TWO NEW POTATOES,

Introduced for the First Time.

We have purchased of Mr. E. S. BROWNELL, of Essex Junction, Vt., his entire stock of the "GREAT EASTERN" and "DICTATOR" Potatoes, perhaps the most valuable two varieties now in cultivation. We give Mr. BROWNELL's description of each.

GREAT EASTERN POTATO.

Mr. BROWNELL says:—I originated this potato in 1880, from the Excelsior and Peach Blow. It grows very large with few small ones; eyes few and nearly even with the surface; tubers oval and somewhat flattened. I took two tubers out of one hill that weighed two lbs. each. They were very smooth and free from prongs. I never saw a hollow or false hearted potato among them. Vines are medium and stocky, foliage dark green, color of skin white, flesh when cooked is *very white, table quality first-rate*. It matures medium early, grows compact in the hill and is easy to dig. It is one of the best producing potatoes I ever grew, if not the most productive, healthy and free from rot or decay.

Per Barrel.....	\$10 00	Per Bushel.....	\$5 00
Per $\frac{1}{2}$ Bushel.....	3 00	Per Peck.....	2 00

DICTATOR POTATO.

Mr. BROWNELL says:—I also originated this potato from the Excelsior and Peach Blow in 1880. DICTATOR grows large with few small ones. It has a bright green foliage, vines medium to large, stocky, and matures medium late, about two weeks later than the Great Eastern. Color of the skin white, eyes few and not very deep. Quality first-rate.

It is very productive, does not grow hollow, cooks white, table quality excellent. It grows compact in the hill, which make it easy to dig. Ninety (90) bushels were grown from one barrel of seed of these large potatoes with common field cultivation cut with two eyes in a piece and two pieces in a hill.

Per Barrel...	\$11 00	Per Bushel....	\$5 00
Per $\frac{1}{2}$ Bushel.	3 00	Per Peck....	2 00

SCALE OF EXPRESS CHARGES ON PACKAGES OF SEEDS, &c., FROM NEW YORK.

For the guidance and convenience of our Customers, we have prepared the following Table of Rates as charged by the Express Companies from New York to most of the Express Stations in the various States and Territories. These rates are only approximate. It is impossible to give them exact, as different rates are charged to different parts of the same State. We will undertake however, to deliver them to any of the Express Stations at these figures.

DIRECTIONS FOR THE CULTIVATION OF VEGETABLES.

To secure a good crop of vegetables, three things at least are necessary, viz., a suitable soil, pure seed, and clean culture, to which may be added as equally necessary, an *abundant* supply of good barn-yard manure, supplemented, when this runs short, by artificial fertilizers. The exposure for a vegetable garden should be preferably south or southeast, or nearly so. The soil should be naturally rich and friable, a sandy loam being among the best. If the soil be stiff, it should be gradually mellowed by the free use of barn-yard manure, or, if convenient, by the addition of sand. If wet, or inclined to hold an excess of moisture, it should be underdrained, preferably by tile; but, if possible, a location should be selected that is naturally dry and free from surface water.

A dark colored soil, or one supplied with a goodly proportion of decayed vegetable matter, will produce the earliest crops. If the soil be shallow, it should be deepened gradually by plowing or spading an inch or two deeper each year, and not all at once by trenching or sub-soiling, unless manure and money be both abundant. A sandy soil may be greatly improved by adding more or less vegetable mould from the woods. To produce the best and uniform results, the vegetable garden should have at least one foot of good rich soil. The roots of large trees should not be allowed to encroach on any part of the garden, though large trees, especially evergreens, sufficiently far off, afford a valuable protection on the north and west.

Mark the garden off into squares or beds of convenient size, to facilitate the practice of a rotation of crops, which is an important matter. As a rule, never let the same crop or kind of vegetable occupy the same bed or spot two years in succession. Potatoes and a few other things may form an exception to this rule, but it is nevertheless better to keep up the rotation. Every year these beds must be warmed up by a liberal coat of manure, which should be thoroughly mixed with the soil. * Grow every thing in drills or straight lines, not even excepting Corn and Potatoes. Larger crops from a given surface are grown in this way, and cultivation becomes simple and comparatively easy. The space between the drills and other special information are given in the body of the Catalogue. The least distance is named in order to economize space. It might be increased in some cases with advantage. The ground should be frequently hoed to kill the weeds and keep the soil mellow; and the proper time to hoe is just when the weeds appear above ground. Briefly, the proper way to kill weeds is never to let them grow. If the weeding be done at the time suggested, it can be mostly and quickly done by the use of a sharp-toothed steel rake.

Where the material and conveniences are at hand, much time may be gained by starting certain kinds of plants in a hot-bed, or even in a cold frame, the latter being a very convenient thing, even on a small place. The hot-bed is chiefly intended for raising early Tomatoes, Egg Plants, Peppers, Cabbage, Cauliflower, Lettuce, &c.; but as all these plants can now be bought cheaply of the seedsmen at the proper time, the expense and labor of a hot-bed can in many cases be dispensed with, especially on small places.

The above brief suggestions, and the special directions dispersed through the Catalogue, if strictly observed, will go far toward securing early and abundant crops.

TO PREPARE A COLD-FRAME.—The cold-frame is simply a frame set on the ground, no bottom heat being applied. It is banked up on the outside during the Winter with salt hay, straw, or coarse litter. The soil is prepared by forking in and thoroughly mixing to the depth of ten or twelve inches a liberal quantity of old, well rotted manure. The manure of an old hot-bed is good for the purpose. The frame is prepared in the Fall, and young Cabbage, Cauliflower, and Lettuce plants set out in it in time to get well established before very cold weather. Cauliflower and Cabbage should be set down to the first leaf, and the soil made firm around the plants. The seed is usually sown, in the vicinity of New York, from the 15th to the 20th of September, but the very early kinds some eight or ten days later. The young plants will be ready to transplant in about twenty-five or thirty days. During cold nights and stormy days, the beds should be closely covered with the sashes, and these further protected by straw mats or shutters. Cauliflower needs more and closer protection than Cabbage, as it is rather more tender. During mild days admit air freely, the object being to keep the plants in a dormant state, without actual freezing, so that when Spring comes the plants are in a forward state for setting out for early crops. Seeds of Cabbage, Cauliflower, Lettuce, and Radish may be sown in a cold frame in the Spring from the last week in February to the first week in March. The frame should stand in a warm and sheltered spot, and be kept from freezing by mats or a thick covering of straw during cold nights.

DIRECTIONS FOR MAKING A HOT-BED.

In the vicinity of New York from the first to the middle of March is quite early enough to make a hot-bed, and even a little later will do well enough. The time must vary according to the latitude. Provide a quantity of fresh horse manure from the stable, and add to this, if they can be had, one-third to one-half its bulk of leaves. Mix them thoroughly, tramping down the mass in successive layers, and form into a large pile, so that fermentation will proceed even in severe cold weather. In two or three days fermentation will be apparent by the escape

of steam from the heap. Now turn again, and allow the heap to remain two or three days longer, or until the second fermentation commences. Make an excavation or pit two and a half feet deep, and of a size suited to the number of plants required. The pit will be better if built up of brick. It should be made in some dry, sheltered spot, facing the South or East, if possible. Hot-bed sashes are usually 6x3 feet, and one sash will generally give early plants enough for a large family. The frame for the sash should be eighteen inches high at the back, and twelve inches in front, which will give the proper slope to catch the most sunlight. Cross-pieces should be placed for the sashes to slide on, to facilitate opening and shutting the frames. When everything is ready, the manure is placed in the pit and trodden down firmly in layers to the required depth, two to two and a half feet. Then put on the sashes, and keep the pit close until the heat rises. At first it will probably be 100° or more, which is too hot to sow the seeds in; but in two or three days it will subside to 90° or a little less, when the soil may be put on to the depth of six to eight inches. The heat may be readily ascertained by plunging a thermometer in the manure. The soil should be of well rotted sod, (or common garden soil will do,) mixed with about a third of fine, old manure, and in this the seeds may be sown thinly in drills two or three inches apart, and afterwards (as soon as out of the seed leaf) either thinned out or else transplanted to another frame. Air must be given every mild day by raising the sashes at the back. Water with tepid water whenever necessary, and during cold nights and snow storms keep covered with straw mats or board shutters. Tomatoes, Peppers, and Egg Plants should be sown in a separate frame from the Cabbage, Cauliflower, and Lettuce, as they require more heat than the latter. The same directions apply to hot-beds made on the surface of the ground, except that the manure should be at least a foot wider on all sides than the frame.

PRICES.

The prices quoted are those ruling at this date, and do not include free transit. Please add sixteen cents per pound for prepayment of postage, if desired by mail.

(See also table of Express tariff, page 4.)

SEEDS BY MAIL OR EXPRESS.

16 CENTS PER POUND should be added for prepayment of Seeds, if wanted by mail. Charges by Express are not uniform; rates depending on distance and locality. (See table of Express tariff, page 4.) Except for small parcels, and to remote parts, the Express Companies will be found the most economical mode of conveyance. Of course we shall always adopt that mode which costs the least. Neither have we charged for a **guarantee** of safe arrival by Mail. It is rare, however, that Seeds fail to reach their destination in that way.

IT IS VERY IMPORTANT

That our customers send in their orders immediately on receipt of this Catalogue, instead of waiting till the time when they wish to sow the Seed; and to save time, Seeds may be ordered by the numbers in the first column, if desired.

We beg our correspondents to give us very exactly, on each of their orders, their name and address; also to indicate very precisely the means of carriage which they prefer, whether by Express, Freight, or Mail, and the Office or Railroad Station which serves their locality.

In case these directions are not followed out, or if they are not sufficient, we shall choose ourselves the most advantageous and convenient means; but **entirely at the risk of the customer**, avoiding ourselves all responsibility.

SHIPMENTS BY EXPRESS "C. O. D."

Unless otherwise instructed, we shall send all such goods as go per Express C. O. D. Orders from unknown customers, not desiring this mode of carriage, should be accompanied by the cash.

In February we publish a list of **Gladiolus and Spring Bulbs**, and in September a Catalogue of **Dutch Bulbous Roots**.

NOTICE.

Write orders upon a blank sheet, separate from letter. Orders from new customers should be accompanied by a Post-Office Money Order, if convenient, or bank-bills, if the amount enclosed is not large. Address,

J. M. THORBURN & CO., 15 John Street, New York.

Whenever our customers desire it, we will select an assortment of seasonable Seeds, suited to their wants. All such orders will receive especial care and attention. The only information we require is the size of the garden and the sum proposed to be expended for Seeds. We would advise making an early test of Seeds, by sowing some of each variety in a flower pot, and keeping them warm and well watered.

We would call attention to the descriptions and directions given in the Catalogue, concerning each variety of Seeds and their culture. They are as full and explicit as the limited space of a Catalogue will admit, and worthy of constant reference and study. The directions are derived from years of experience, and aim to meet the requirements of soil, climate and culture, in and around New York. For more Northern and Southern localities, changes in the time of sowing, &c., are, of course, necessary, and will readily suggest themselves.

WARRANTIES.

Seeds of the best possible quality will fail through improper treatment. Thus, if a small seed be sown so deep that the young plant cannot reach the surface, the seeds, however good, will fail. More failures result from a want of proper knowledge of the conditions necessary to germination than from the bad quality of the seeds themselves. These conditions are: A proper temperature, sufficient moisture, and free access of air; besides these, the soil must be in a proper condition, and present no mechanical obstacle to the growth of the young plant. If heavy rains have compacted the surface of the soil, and the sun has baked it to form a hard crust, it will be impossible, even if all other conditions are favorable, for the seedling plants to force their way through it; and many perish from this cause alone. Seeds differ greatly as to the temperature required for germination; Beets, Cress, Peas, etc., germinate readily at a temperature of 45°; but if Melons and other seeds of that family, bush or pole Beans, and other plants of sub-tropical origin are sown under the same conditions, they will be apt to decay, as for their prompt germination they require a heat of at least 60°. For this reason many seeds fail yearly from too early sowing. The second condition, proper moisture, is likely to be violated by an excess rather than by too little moisture. The proper amount is that which a well drained soil will naturally hold. Free access of air is all important, and this is interfered with by an excess of water in the soil. In germination complex chemical changes take place in the seeds, in which the air performs an important part. A portion of the seed is consumed, carbonic acid gas being given off, in changing the starch and other constituents of the seed into nutriment to forward the growth of the germ or embryo plant, which depends upon the contents of the seed until it has formed roots below ground and leaves above, and is able to sustain itself. Besides these conditions affecting the germination of the seed, the young plants, after they have made their way to the surface, are liable to various accidents; a sudden current of very cold air, or a continued drying wind, may check their growth, or destroy the young plants altogether; besides these, there are numerous insects, both below and above ground, that may attack the plants, some of these being so small that they often destroy a crop before they are discovered.

For the above reasons, we wish to state in this explicit form, *that while we exercise the greatest care to have all Seeds pure and reliable, we sell no Seeds with warranty, express or implied, in any respect, and will not be in any way responsible for the crop. If the purchaser does not accept the Seeds on these terms, they must be returned at once.*

SNOWBALL CAULIFLOWER.

\$5 per oz., 25c. per packet.

SELECT NOVELTIES IN VEGETABLE SEEDS.

- BEANS, "Transylvania Butter."** *A new Pole Bean, with broad green stringless pods 10 inches long, fine and very productive. Per quart.....* \$0 50
- CABBAGE, "New Flowering Head Cabbage."** *Quite a distinct novelty from Germany, the outward appearance of this Cabbage is not unlike a pointed Wakefield, but by cutting in half the interior will be found filled with miniature cauliflowers, which it resembles in flavor. Per packet....* 30
- CELERY, "Improved White Plume."** *This Celery has been in cultivation to a limited extent by the market gardeners in the vicinity of Newark, N. J., for the past seven or eight years under the name of "White Heart." It is claimed by some that the seed was first brought there by a Chinaman, but others equally reliable state that it was found amongst the Golden Heart, and that it is a sport of that variety. However that may be, it is a valuable early market sort, the entire plant generally, with the exception of the outer stalks, being naturally silvery white, requiring but little labor to put in shape for market. Its only fault is that it rarely keeps after Christmas. Per oz., \$2; per packet...* 25
- CORN, "Perry's Hybrid Sugar."** *This is the largest extra early sweet corn in cultivation of fine quality, the ears are twelve rowed and twice the size of Minnesota and earlier, most valuable sort. Per quart.....* 40
- MELON, "Golden Perfection."** *A new highly perfumed melon of exquisite flavor from Italy, very sugary, small size, slightly oblong, fine netted skin and golden yellow flesh. Per packet.....* 25
- PEAS, "Cleveland's Rural New Yorker Peas."** *Said to be the most prolific, as well as the earliest Pea yet produced. Its uniformity of ripening.—All the pods, from the bottom to the top of the haulm, being fully developed, permitting the entire crop to be removed at one picking—a most important consideration to the Market Gardener. Its wonderful productiveness.—The Rural New Yorker of September 1, 1883, reports a trial of Extra Early Peas:—"100 pods weigh 19 ounces, containing 654 seeds, which weigh 8 ounces," an average of six and a half remarkably large Peas to the pod. In comparative test with these were several other Extra Early Peas, selected as being the best representative of their class. A summary of the Rural report shows that one hundred pods taken from the R. N. Y. (Rural New Yorker) Pea weighed 5½ ounces more than a like number taken from the next best variety, and 13¾ ounces more than the same number of pods from the poorest, while the Peas taken from the one hundred pods weighed 2½ ounces more than the seeds of the next best Peas, and 5¾ ounces more than those of the poorest. Per quart.....* 50

- PEAS, "Horsford's Market Garden Pea."** *This new wrinkled pea is the result of a cross between the Alpha and American Wonder, grows from 15 to 30 inches high, is very stocky and requires no bushing. It is extremely prolific and bears its pods always in pairs. Each vine throws out from 15 to 25 laterals, 10 to 15 inches long, and on some of the best plants over 150 pods have been counted. Twenty bushels have been grown from 35 pounds of seed. Its habit is such that a small amount of seed will plant a large plot of ground. Plant the seeds from 3 to 6 inches apart in the drill. It ripens about the same time as McLean's Advancer, and those who have eaten it pronounce it one of the sweetest they have tasted. Per packet.* \$0 25
- RADISH, "Beckert's Chartier."** *This new Long Radish is described by the originator as deep crimson, varying into a delicate pink to the middle, and thence downward it is a pure waxy white, the quality is unsurpassed. Per packet.* 25
- RADISH, "Extra Early Roman Carmine Turnip."** *Small and delicate, high color, finest for frames. Per lb., \$1.50; per oz.* 20
- RADISH, "Early Globe Shaped Prussian Carmine Turnip."** *New and quite distinct crisp round Radish of brilliant color, fine for forcing. Per lb., \$1.50; per oz.* 20
- SQUASH, "New French Olive."** *The shape and color of this Squash is exactly that of an olive, its weight attains from 6 to 10 lbs., the skin is smooth and extremely thin and the flesh thick, firm, of a golden yellow color and of remarkably good quality. Per lb., \$2.50; per oz.* 25
- SQUASH, "New Pine Apple."** *Said to be a cross between "White Bush" and the English Vegetable Marrow, adapted for Summer, Fall or Winter use, for Pies, cut in slices, fried or stewed, it is first class. Per lb., \$2.50; per oz.* 25
- TOMATO, "King Humbert."** *King Humbert is particularly recommended on account of its earliness, the handsome form of its fruit, and delicious flavor. It is of a glossy scarlet color, very smooth, of the size and shape of a very large plum, and contains but few seeds; the flavor may best be compared to that of an apple. No Tomato equals it in productiveness. Per oz., 75c.; per packet* 25

VEGETABLES.

ARTICHOKE—**ARTICHAUT**—*Alcachofa*—*Artichôte*.

FRENCH ARTICHOKE.

No. 15 French Green Globe, 7 oz., 35 cents; 7 lb., \$3.50.

No. 18 Large Paris, *very hardy*, 7 oz., 75 cents.

CULTURE.—Deep, rich, sandy loam, with plenty of well-rotted manure. Sow seeds in April and May, and, when large enough, transplant into rows three to four feet apart and two feet in the rows. They reach maturity the second year. Cover with litter when cold weather commences, first tying up the leaves so that they will occupy less space, and in spring fork in a dressing of manure. It is an excellent vegetable and easily grown, thriving in any situation, provided the heads are cut off and used as fast as they get ready; if left to ripen on the plant they exhaust it, and no more are produced that season. When cut regularly

they are produced in succession for a good while. Heads are unfit for culinary purposes after the flowers expand; hence the indifferent opinion entertained of this vegetable through these being cooked after they have passed the proper stage, when they are tender and delicious.

ASPARAGUS—**ASPERGE**—*Esparrago*—*Spargel*.

	per oz.	per lb.
20 French Argenteuil.....	25 cts.	\$1.50
24 Conover's Colossal.....	10 cts.	.50
" " 2 year old roots, per 1000 \$8; per 100 \$1.00		

ASPARAGUS.

CULTURE.—Sow the seeds thinly in rows one foot apart in April or May, and keep down all weeds. Radish or Lettuce seed may be mixed with it, so as to mark the rows readily, and allow the weeds to be destroyed as soon as they appear. To secure strong, healthy plants, thin out the seedlings to three or four inches in the rows, saving only the strongest. The one year old plants should be set out in the Spring, in a rich, sandy loam, dug eighteen inches or more deep, into which has been worked plenty of well-rotted manure. If a stiff clay soil is all that can be had, add plenty of sand to loosen it up, and also see that it is well underdrained. In planting for private use, set out in beds five feet wide, three rows in a bed, the outer being each one foot from the edge, and allow twelve inches in the row. Set the plants at least six inches below the surface. If set out in the Autumn, we recommend a top dressing of at least six inches of manure. For market on a large scale, set four feet apart one way and one and a half the other, which will allow the use of a horse and cultivator to keep the weeds under. Every Fall a good dressing of coarse manure should be ap-

plied after the tops have been cut, and in the Spring forked in. In localities away from the seacoast, a dressing of coarse salt given in Spring, at the rate of two pounds to the square yard, will be found very beneficial.

ENGLISH DWARF BEANS—*FÊVE DE MARAIS*—*Haba*—*Große Bohnen*.

	per bus.	per qt.		per bus.	per qt.

95 White Scimeter.....	4 50	25
97 White Kidney.....	4 00	25
99 White Marrow.....	3 00	25

KINDS.—Nos. 36, 41, 42, 59 and 64 are the earliest. No. 45 the most hardy. Nos. 36 for green and 64 for yellow pod are best. No. 90 and 91 also for late, and best for pickling. Nos. 64 to 75 are the Dwarf Wax varieties, with yellow, transparent pods. Nos. 75 and 81 are the celebrated Flageolet Beans of the French; and although used as a string bean they are superior only as a shell variety, cooked precisely as the Lima they are delicious.

CULTURE.—About the first of May select a warm, dry, sheltered spot; dig and manure slightly; make drills two inches deep and two feet apart; drop the Beans three inches apart in the drill, and cover not more than two inches deep. Keep hoed, when not wet, and the weeds killed. Sow every two weeks for a succession.

POLE or RUNNING BEANS—HARICOTS A RAMES—*Frijole de bejuco*—
Stangen-Bohnen.

139 Speckled Large Lima.16 00		75	179 French Yard Long (cu- rious and fine).....		1 25

KINDS.—Nos. 115, 118, 162, and 169 are best for Snaps, and Nos. 129, 133, 134 and 149 the best for Shell Beans, and most valuable for main crop.

CULTURE.—Sow as soon as the soil becomes warm and dry, from the first part of May for all except Limas, to the latter part of May, in hills four feet apart each way. Limas should not be planted until warm weather has fairly set in. One quart of Limas will make about 100 hills, allowing four to five beans to a hill, and of the smaller sorts about 200 hills. Poles, eight to ten feet long, should be firmly set in the center of the hills before putting in the seed.

EGYPTIAN BEET.

YELLOW OVOID MANGEL.

BEEF—BETTERAVE—*Remolacha*—Runkelrüben.

	lb.	oz.		lb.	oz.
195 Extra Early Dark Egyptian	\$0 75	10	242 Victoria (<i>metallic-red foliage</i>)	\$3 00	30

229 Long Smooth Blood	60	10	251 Scarlet " "	1 50	15
240 Ne Plus Ultra (<i>dark foliage</i>)	1 50	15			
241 Crown Prince (<i>deep red foliage</i>)	2 00	20			

KINDS.—Nos. 195, 206 and 215 are the earliest and best, if used when young. We recommend for early Summer use Nos. 195 and 215, for General and Winter use; Nos. 214 and 229 also, for Late and Winter crops. Nos. 240 to 251, for ornament, are fine for borders or edgings on account of their brilliant foliage.

CULTURE.—Sow as early in the Spring as the ground can be worked, and every two weeks after for a succession, up to the first week of July. For general crop sow about the middle of May. The soil should be a light sandy loam, well enriched with stable manure, and plowed and harrowed until very fine. Sow in drills one foot to fifteen inches apart, and when well up thin from four to six inches. The young Beets pulled out of the rows are excellent used as Spinach.

BEET—MANGEL WURZEL, SUGAR, Etc.

	lb.	oz.		lb.	oz.
260 Long Yellow Mangel Wurzel	50	10	280 Golden Tankard Man Wurzel	50	10
263 Long Red	40	10	283 Mammoth Long Red....	50	10
271 Yellow Globe	50	10	284 Mammoth Golden.....	1 50	15
272 Kinver's Yellow Globe	50	10	290 White Sugar.....	40	10
274 Red Globe	50	10	293 Vilmorin's Imp. Sugar...	1 00	10
278 Yellow Ovoid	50	10	298 Lane's Imp. Sugar.....	50	10

KINDS.—Nos. 260 to 284 inclusive are for feeding cattle. Nos. 290, 293 and 298, for making sugar from, as well as for cattle feeding.

CULTURE.—As all Mangels require a deep soil in order to grow well, plow and subsoil at least a foot to eighteen inches, and apply plenty of rich manure. Sow in May and June, in rows eighteen inches to two feet apart, and thin to eight inches in the rows. Young plants may be transplanted to fill up vacancies. A celebrated cultivator advises to sow in addition, when the plants are three to four inches high, at the rate of 100 lbs. Blood Guano, 200 lbs., Bone Flour and 400 lbs. Salt per acre. As soon as frost occurs dig the crop. But, in order to be well preserved for gradual consumption during the winter, Mangel Wurzel should be heaped to a height of perhaps six feet, on a dry, sloping situation. Cover at first with a piece of canvas, and, as the cold increases, this should be replaced by about six inches of either salt-hay, straw, sea weed, or even corn stalks. Lest this covering be displaced by the wind a light layer of earth is necessary. So soon as this surface soil becomes frozen, about six or eight inches more of earth should be placed over the entire heap. By following up this gradual process of covering, all danger of heating will be obviated. Sow from four to five pounds to the acre.

BORAGE—BOURRACHE—*Borrajā*—Borretsch.

lb. ounce, 15 cents; lb., \$1.00.

The young leaves of this Annual, which smell somewhat like a Cucumber, are used as salad or boiled as Spinach. Should be sown at intervals, as the leaves are palatable *only when young*.

CULTURE.—Sow in the Spring, in light soil, and transplant to shallow drills, a foot apart, when of about six weeks' growth.

BROCCOLI—BROCOLI—*Brocoli*—Spargelfohj.

	lb.	oz.		lb.	oz.
300 Early White.....	\$3 00	30	308 White Cape.....	\$7 00	60
302 Early Purple.....	3 00	30	310 White Sprouting.....	3 00	30
304 Early Walcheren.....	7 00	60	312 Sulphur-Colored.....	3 00	30
306 Early Purple Cape (fine).	4 00	40	314 Chappel's Cream.....	3 00	30

KINDS.—The above are the sorts best adapted to this climate, and the only ones which succeed generally. We recommend No. 306 as the most certain.

CULTURE.—Sow early sorts as soon as the ground can be worked in the Spring, in shallow drills, drawn three or four inches apart. Plant out two feet apart each way, when plants are four inches high. Cultivate the same as Cabbage, in rich soil.

BRUSSELS SPROUTS.

BRUSSELS SPROUTS—CHOUX DE BRUXELLES
—*Berza de Brussels*—Kofentohl.

	lb.	oz.
316 Best French, or Roseberry.....	\$2 00	20
318 Improved Dwarf	2 50	25

CULTURE.—Sow in May, in the same manner as Cauliflower and transplant in July, one foot apart in the rows. In gardens both large and small, Brussels Sprouts are without exception the very best winter vegetables that can be grown. Not the least valuable point connected with the Brussels Sprout is that it is as hardy as the common curled Greens. The common Cabbage is hardy enough in a young state, but when full grown and hearted frost soon destroys the large heads, which rot and fall to pieces. Not so the Brussels Sprouts; being small and hard, it is not in the least affected by frost. The real Sprout is not much larger than a marble, and as firm and hard almost as the stalk itself. These are the sort which cooks prefer; they strip off their outer covering, cook them whole, and serve them up artistically in that fashion. When cooked through and no more, such Sprouts melt in the mouth, like the tenderest Cauliflower, and are equally good.

BURNET—PIMPERNELE DE JARDIN—*Pimpernella*—Pimpernell.

324 Garden, 10 cents per ounce.....\$1.00 per pound.

CULTURE.—Sow early in Spring, half an inch deep, thinly in rows. The leaves have a warm, piquant taste for salads and soups.

CABBAGE—CHOU—*Berza de repollo*—Kohl.

	lb.	oz.		lb.	oz.
329 Etampes, (very fine).....	\$2 00	20	403 Early Flat Dutch.....	\$4 00	40

399 Large Early York	1 50	20	460 Red Solid (for pickling)...	2 00	20
401 Improved Early Summer..	4 00	40			

KINDS.—Nos. 329, 330, 356 and 365 are the earliest. Nos. 369, 401 and 403 are the best for second early. We particularly recommend No. 401. Nos. 412 and 415 are the well-known Winter varieties. Nos. 412, 415 and 418 are the best for main crop. No. 448 is the best for family use.

IMPROVED EARLY SUMMER CABBAGE.

CULTURE—Soil for Cabbages should be a rich heavy loam, with good drainage. On such a soil, with an abundance of stable manure, excellent crops are sure to be grown. For early Spring sow in Fall, not too early, or the plants are liable to bolt in the Spring instead of heading, and in a month the plants will be fit to transplant to cold frames, where they are wintered, taking care, in planting, to set the young plants down to the first leaves. Transplant in Spring as soon as the ground can be worked, setting the plants two feet apart one way, and from twelve to eighteen inches the other, according to the variety. If it is desirable to economize space, Lettuce or Radish may be sown between the rows, as they will be out of the way before the Cabbages need the room. For late or Winter crops the seed is sown in May, and the plants set out in July. In this case they are set in rows two by three feet, so as to work them with horse and cultivator. To prevent the Turnip Flea attacking the young plants, sift fine air-slacked lime over them as soon as they appear above ground. Lime or bone-dust make excellent fertilizers for this crop if sown and harrowed in lightly before the plants are set out.

CARDOON—CARDON—*Cardo*—Gardon.

465 Large Solid, 40 cents per ounce.

CULTURE.—Sow early in Spring, in rows, where they are to stand, and thin them to one foot apart. When full size, bind the plants together with straw or matting, and earth up like Celery to blanch. The stems of the leaves are used for salads, soups, and stews.

FORCING CARROT.

EARLY HORN CARROT.

HALF LONG CARROT.

LONG ORANGE CARROT.

CARROT—CAROTTE—*Zanahoria*—*Möhren*.

	lb.	oz.
469 Extra Early Forcing.....	\$1 00	10
473 Early Scarlet Horn.....	1 00	10

480 " " " Nantes strain.....	1 00	10
484 New Half Long Luc (short thick).....	1 00	10
484a Half Long Danvers.....	1 00	10
485 Best Long Orange.....	75	10
489 Altringham.....	75	10
493 Long White.....	50	10

KINDS.—For the earliest and latest crops No. 469. It is very tender and fine for the table, and may be sown from April to August. Nos. 476, 484, and 485 are the best for the main crop. No. 485 is particularly recommended for stock; sow two pounds to the acre.

CULTURE.—Sow No. 469 as early as the ground can be worked; or for late crop, until latter part of July; for main crop, sow from the middle of May to 1st of July. Thin out early crop to five inches in row; main crop six to seven inches; the rows ten inches apart for early crop; fourteen for main crop. Hoe often and deeply between rows. Soil, light sandy loam, richly manured and deeply dug.

CAULIFLOWER—CHOU-FLEUR—*Coliflor*—*Blumentohl*.

	lb.	oz.		lb.	oz.
499 Extra Early Dwarf Erfurt.. ½ pkt., 50c.	\$9 00		509 Early London	\$5 00	50
503 Early Dwarf Erfurt... \$30 00	2 00		512 Thorburn's Nonpareil.	6 00	50
504 Early Snowball, ½ pkt., 25c.....	5 00		513 Half Early Df. French	6 00	50
505 Early Paris..... 10 00	75		514 Stadtholder.....	6 00	50
506 French Imperial 10 00	75		517 Walcheren.....	6 00	50
507 Large Algiers 8 00	60		522 Late London.....	5 00	50
			524 Lenormand's.....	7 00	60
			527 Autumn Giant.....	6 00	50

KINDS.—Nos. 498 to 505 will be found the finest varieties for early, and Nos. 499 and 504 for forcing. Nos. 507 and 512 for late. No. 524 is also highly recommended.

CULTURE.—This is the same as for Cabbage, except that extra manure and plenty of water will pay upon this. If the soil be dry, water frequently, and if the plants could have a heavy mulch of hay or straw, it would keep the soil moist, and the plants would not suffer from drought. The early kinds should be strong enough to plant out not later than the middle of April, the late kinds may be planted out same time as for Cabbage.

530 Golden Heart.....	4 00	40	549 Giant White Solid	3 00	30
531 Boston Dwarf.....	4 00	40	553 Celериac, or Turnip rooted	1 50	20
533 Crawford's Half Dwarf.	4 00	40	555 New Apple Celериac...	1 50	20
534 Walnut.....	4 00	40			

KINDS.—Nos. 529, 530, 533, and 549 are the best sorts for family use. We recommend No. 528 for early and No. 529 for main crop. These two sorts are also best for market gardeners.

CULTURE.—Sow the seeds in a light, rich, dry border as early as the ground can be worked. In drills eight or ten inches apart, and cover the seeds about a quarter of an inch deep, rolling or treading them in if the ground be dry. When fairly out of the seed leaf they may be transplanted to another bed, or they may be thinned out to six or eight inches apart, and left to grow till wanted to plant out in beds or trenches. The beds should be kept well weeded, and an occasional soaking with water in dry weather will do the plants good. Early in July at the North, and a month or six weeks later in the Southern States, is the proper time to set the plants out in beds or trenches. Press the soil firmly against the roots. In the garden the better way is to set the plants in shallow trenches. We say shallow, for it is obviously a bad plan to remove all the good soil, (as must be done in a deep trench,) and put the plants in that which is poor. The plants may be set in a single row in a narrow trench, or the trench may be made into a bed wide enough to hold two, three, or four rows, and in this case the plants are in a compact form to be covered for the Winter where they grow. This will save much labor where there is no root cellar for storage, as often happens to be the case. When grown in beds in this way, the rows should be one foot apart, and the plants about eight inches apart in the rows. A bed four feet wide will take four rows of plants, leaving six inches of space on the outside of the first and last row. The bed should be made very rich with thoroughly decomposed manure. The plants will need to be earthed up two or three times; and in doing this care should be taken not to let the earth get into the heart or center of the plant. In field culture the plants are set on the surface in rows four feet apart when the Celery is to be earthed up in the field for early use, and two feet apart when the plants are to be taken up and blanched in the cellar for Winter use. The plants are set six inches apart in the rows. The weeding is done by horse power, and the earthing or banking up is mostly done by the plow and the spade. If not grown in beds, the best way to store is to dig trenches in a well-drained spot in the open ground one foot wide, and of a depth a few inches less than the height of the Celery. The plants are then lifted and set closely together until the whole quantity is stored. The edges of the trench should be made sloping from the tops of the plants to carry off all surface water. When severe cold weather comes on, cover with leaves, hay, or straw, and place boards on the top to keep out the moisture. The covering must be put on gradually, else there will be danger of heating, and consequent decay. In such a trench the stalks will blanch perfectly, and may be taken out any time during the Winter. If left in the beds where grown, they should be protected by a heavy coat of leaves, straw, &c. The Turnip rooted, or "Knob" Celery, needs no earthing up, and may be planted in rows one foot apart.

IMPROVED WHITE PLUME CELERY.

CURLED CHERVIL.

CHERVIL—*CERFEUIL*—*Perifollo*—
Benjenlauch.

559 Curled, 15c. P oz., \$1.00 P lb.

563 Tuberous, 20c. P oz., \$2.00 P lb.

CULTURE.—Cultivate and use like Parsley. Sow at any time in the Spring, in shallow drills, one foot apart. The seed of the Tuberous Chervil should be sown in August or September, and treated like the Carrot.

CHICORY.

COMMON OR WILD.—“*Barbe de Capucin*,” a salad much used in France. Sown in June, the roots are transplanted in Autumn into sand in a cellar, the shoots, which will come up soon, form the *Barbe de Capucin*. Per lb. \$1.00; per oz. 10c.

WHITLOOF.—Sow in June; plant the roots one inch apart, from October to the closing of the ground, in rows eight inches apart, in a trench one foot deep, cut off the leaves. Cover the roots with well-sifted soil eight inches thick, and the whole with a good layer of dung two to three feet thick, more or less, according to the temperature and the quickness of growth required: the Whitloof will be produced three weeks afterwards in the intermediate cover of soil. Excellent as a salad as well as a cooked vegetable. Per lb. \$1.00; per oz. 10c.

Large rooted, roots of this variety are used for the Chicory of commerce. Per lb. \$1.00; per oz. 10c.

COLLARDS—*CHOU-CABU*—*Cabu*—*Blätterkohl*.

568 Georgia Grown, 15 cents P oz.; \$1 25 P lb.

CULTURE.—Sow seeds as for Cabbage, in June, July, and August, for succession. Transplant when one month old, in rows a foot apart each way, and hoe frequently.

CORN SALAD, or FETTICUS—

MACHE—*Macha o Valerianilla*—*Stechsalat*.

	P lb.	P oz.
572 Large Seeded.....	\$1.00	10
575 Small Seeded.....	1.00	10
576 Green Cabbaging.....	1.50	20
577 Lettuce Leaved.....	1.50	20

CULTURE.—Sow during August, or early in September, in drills a quarter of an inch deep and six inches apart. If dry weather, tread in the seed lightly. Keep down weeds with hoe. Just before the first of Winter cover thinly with clean straw or leaves. A delicious hardy salad.

700 Broad-Leaved	50	10	708 Erfurt Sweet Water Cress.....	75
703 Broad-Leaved Winter....	75	10		

CULTURE.—Sow Nos. 698 and 700 thickly, in shallow drills, every two or three weeks. No. 698 should be cut often, and it will continue to grow. It is useful not only for salad, but for the breakfast table and for garnishing. Nos. 706 and 708 should be sown in damp soil; or if a stream of water can be utilized, they would be very fine. It also thrives well in hot-beds.

CUCUMBER—CONCOMBRE—*Pepino*—Gurten.

757 New White Japan	1 00	10
760 Small Gherkin (Burr)....	2 50	25

KINDS.—Nos. 710, 714, 718 and 720 are the earliest. No. 725 is the favorite kind for table use. Nos. 718, 725 and 743 for pick-

LONG GREEN CUCUMBER.
ling, and No. 725 also for general use; No. 743 is best for market gardeners or pickle planters. No. 757 is a pure white variety.

CULTURE—For very early, sow a few seeds in hot-beds upon pieces of sod, or in small pots, and they can be readily transplanted with a gain of about six weeks before they can be sown in the open ground. Plant out in rich soil when danger of frost is over, or they may be protected by hand glasses, or even by a paper held down at the corners with a handful of earth. For general crops, sow in the open ground as soon as the weather is settled and warm, and again every two weeks for a succession. For pickles, sow from the middle of June to the first week in July. Sod land, turned over in the Fall, is the best for them. Plant in hills four feet apart, putting a shovelful of well-rotted manure in each hill.

CUCUMBER—ENGLISH VARIETIES FOR FRAMES.

CONCOMBRE (especes Anglaises) pour couches.

Packets contain from 5 to 15 seeds each, according to sort.

	⌘ pkt.		⌘ pkt.
768 Carter's Tender and True	\$0 25	788 Lord Kenyon's Favorite	\$0 25
770 Duke of Edinburgh	25	790 Prize Fighter	25
772 General Grant	25	795 Goliath	25
774 Giant of Arnstadt	25	797 Telegraph	25
776 Long Gun	25	799 Lynch's Star of the West	25
778 Blue Gown	25	802 Lancashire Witch	25
779 Marquis of Lorne	25	804 Cuthill's Black Spine	25
785 Invincible	25	806 Improved Sion House	25

CULTURE.—The above are for growing in hot-beds, or in houses particularly constructed for forcing, so that a supply can be furnished during the Winter months, at which time the prices are very remunerative. Sow seeds in November, December, or January, according to the time they are wanted for market, taking care to give plenty of air and water. It will be necessary to fertilize the pistillate flowers with the staminate, in order to render the vines productive, as, owing to the absence of insects, they will not produce a crop under glass the same as in the open ground, where bees and other insects have free access to the flowers.

DANDELION—PISSENLIT.

809 French Garden, 20 cents ⌘ ounce; \$2.00 ⌘ pound.

811 Improved Thick-leaved, ⌘ oz. 75 cents.

CULTURE.—The Dandelion is a hardy perennial plant, and one of the most desirable early Spring salads. Sow in early Spring, in drills half an inch deep and eighteen inches apart; thin out the plants to 12 inches. Keep clear of weeds during the Summer, and the ensuing Spring the leaves will be fit to cut. They are best, however, when blanched, which makes them tender and destroys to some extent their bitter taste. The blanching may be done, by placing a couple of boards over the rows, thus: **A**

DANDELION.

EGG PLANT—AUBERGINE—*Berengena*—Eierpflanze.

NEW YORK EGG PLANT.

Cool nights or wet weather will check them. Keep some back in frames for a second planting, in case of weather changing unexpectedly. Keep plants watered for a few days, if the sun is hot when put out. Set out plants three feet by two.

	per lb.	per oz.

826 Scarlet Chinese (beautiful).....		40
834 Round White.....		40
835 Long White.....		40
835a Striped.....		40

KINDS.—Nos. 812 and 815 are the earliest. No. 818 is the largest and most productive, and best for main crop; No. 822 is of excellent flavor, with ornamental dark colored leaves.

CULTURE.—Sow in hot beds, very early in Spring; and transplant when two inches high into a second bed, or into small pots. If that is not done, thin to four inches apart. Do not plant out till the weather becomes perfectly settled and warm.

ENDIVE—CHICOREE—*Escarola* o *Endivia*—Endivien.

	per lb.	per oz.		per lb.	per oz.
836 Green Curled Winter...	\$2 00	20	844 Moss Curled.....	\$3 00	30
840 White Curled	2 50	25	846 Broad-leaved Escarolle..	2 50	25

KINDS.—All equally good. No. 836 is the most hardy.

CULTURE.—Sow in June, July and August; cover lightly. When up, thin out to eight inches apart, and give a good watering afterward, if dry. When the leaves are six or eight inches long, blanch by gathering in the hand and tying together near the top with yarn or bast. This must be done when quite dry, or they will rot. At the approach of Winter, take up carefully, with a ball of earth to each plant, and place close together in frame or cellar for use. They must be kept dry, and have plenty of air, or they will rot.*

WINTER CURLED ENDIVE.

Ice Plant—*FICOIDE GLACIALE*.

847 Clean Seed, 50 cents per lb. oz.; per packet, 5 cents.

CULTURE.—Sow in good garden soil as soon as the ground becomes warm in Spring, in shallow drills one foot apart. A desirable vegetable for boiling like Spinach, or for garnishing.

KALE—CHOU VERT FRISE—Col—Blätterfohl.

	per lb.	per oz.
848 New Dwarf Erfurt, <i>fine yellowish green curled</i>	\$2 00	20
849 Dwarf Green Curled Scotch.....	1 00	10
851 Dwarf Brown German Curled.....	1 00	10
856 Cottagers.....	2 00	20
859 Garnishing (<i>variegated</i>).....	3 00	30
861 Siberian German Greens.....	75	10
864 Sea Kale.....	3 50	35

DWARF SCOTCH KALE.

KINDS.—From Nos. 849 to 859 are Borecole. No. 864 is a fine vegetable, having the appearance of White Celery, and is cooked the same as Asparagus. No. 861 is used for early Spring Greens. No. 856 is a very tall and productive sort, highly recommended.

CULTURE.—Nos. 849 to 859 are cultivated and grow exactly like Cabbage. No. 861 sow in September for early Spring Greens. Sow No. 864 early in the Spring in a hot-bed, and when from one to two inches high transplant into a bed or border that has been highly manured and deeply dug. The plants should stand two feet apart in the rows. The rows (if more than one) should be three feet apart. The soil should be kept mellow and free from weeds. Cover with litter or leaves during the Winter. Plants started and grown in this way should be fit to blanch the following Spring. The seed may also be sown early in the open border, and transplanted in rows, (as directed above,) as soon as out of the seed leaf; but they will need to be a year older than the hot-bed plants before being fit to blanch. Sea Kale is not fit to eat till it has been blanched. The plants are blanched either under large pots or by banking up with sand. The midribs are the parts eaten. They are cooked like Asparagus, and usually served with drawn butter. An occasional top dressing of salt is beneficial to the plants.

KOHLRABI, or Turnip-Rooted Cabbage—CHOU-RAVE—Colinabo.

869 Early White Vienna.....	per lb. \$2 50	per oz. 25
870 " " " <i>extra</i>	" 4 00	" 40
873 Early Purple Vienna.....	" 3 00	" 30
876 Large White or Green.....	" 1 50	" 20

KINDS.—No. 869 for early forcing, and also for general crop. This is an excellent vegetable, and should be grown in every garden.

CULTURE.—Sow in Spring, in rows eighteen inches apart, afterward thinning the plants to eight or ten inches. If the weather is suitable, the thinnings may be planted, but it is considered difficult to transplant. Keep the weeds down, and when the thickened stem above ground is two or three inches through, they are fit to eat; being tough when old. They are cooked same as Turnips.

WHITE VIENNA KOHLRABI.

LEEK—**POIREAU**—*Puerro*—*Porro*.

919 White Cabbage.....	1 50	20	958 Red Cos.....	2 00	20
927 Golden Stone Head (fine)	2 50	25	966 Hardy Green Winter ...	2 00	20
929 India Head	1 50	20	967 " Red "	2 00	20

KINDS.—Nos. 888, 895, 897, 905, and 927 are best for forcing or earliest Spring crop. Nos. 895 and 898 also for succession kinds. Nos. 898, 909, 915, 919, and 945 are fine for main Spring and Summer crops, Nos. 898 and 915 for Fall. Nos. 953 and 956 are also highly recommended, but a little more trouble to raise.

CULTURE.—Sow Nos. 888, 895, 897 and 905 in hot-beds in March, and in the open ground as soon as it can be worked, and transplant to rows eight inches apart. Sow in two weeks' time same varieties again, as also Cos for a succession. In August, sow any of the varieties, except No. 966, which should be sown in September. In October, some of these may be planted in frames to head in Winter and early Spring. Always sow thin, and thin out well, or the plants will not be strong. The last Spring sowing had better be grown where sown, being thinned out to six or eight inches apart. To have Cos in good order, they must be sown in a hot-bed early in the year and transplanted to a cold frame, so as to have them good plants to set out at the opening of the ground. They require tying when grown, for a few days, to blanch. Lettuce requires good ground and moisture in abundance.

MARTYNIA—FOR PICKLES.

975 *craniolaria* 7 lb., \$3.00; 7 oz., \$0 30 | 976 *proboscidea* 7 lb., \$3.00; 7 oz., \$0 30

KINDS.—Both are productive and fine for Pickles. Pick when small and tender, and preserve the same as Cucumbers.

CULTURE.—Sow in May, in the open ground, three feet apart in each direction, where the plants are to remain; or the seed may be sown in a hot-bed, and the seedlings afterward transplanted.

<i>fume</i>	5 00	50

GOLDEN PERFECTION MUSK MELON.

KINDS.—Nos. 981, 983 and 998 are the earliest varieties. For general and early we recommend Nos. 980 and 981 particularly for northern localities. In addition to these for general crop, we recommend Nos. 986, 989 and 992. No. 978 is a new sort and perhaps the finest ever introduced.

CULTURE.—Select a light, sandy, rich soil, and after all danger of frost is over and the ground has become warm and dry, plant in hills four to six feet apart each way, six to twelve seeds to the hill. When up, and all danger of insects has passed, pull out all but three plants. Cultivate until the vines cover the ground, and pinch the ends of the growing shoots to induce early fruiting. Ashes, lime, or even dry road dust is excellent to sift over the young plants when the dew is on, to prevent the attacks of insects. A few hills for early may be had by sowing in hot-bed on pieces of sod or in pots. The seeds may also be started out of doors under hand frames or glasses.

1053 Early Mountain Sprout..	75	10	1100 Citron, for preserves... 1 00	10	
1057 Cuban Queen.....	1 00	15			
1060 Black Spanish.....	1 00	10			

KINDS.—Nos. 1042, 1053, 1073 and 1077 are the earliest sorts, and Nos. 1040, 1041 and 1043 are the finest for general crop. Nos. 1057 and 1095 are popular Southern sorts of excellent quality.

MUSHROOM.

CULTURE.—Treat the same as Mushroom, except that they should be planted eight to ten feet apart, according to variety.

MUSHROOM SPAWN—BLANC DE CHAMPIGNON—Seta—Champignonbrut.

English Spawn, 12 cents per lb.; 10 lbs. for \$1.00.

French Spawn, per 3 lb. box, \$1.25.

" " in bulk ½ lb. 35c.

CULTURE.—Mushrooms may be grown in cellars, under benches of green-houses, or in sheds, wherever the temperature of 50° to 60° can be kept up through Winter. The bed should be made from November to February, according to the time the Mushrooms are wanted, and it

requires about two months for them to begin bearing. Secure fresh horse dung, free from straw and litter, and mix an equal bulk of loam from an old pasture with it. Keep this under cover, taking care to turn it every day to prevent heating, until the pile is large enough to make a bed of the required size. A bed three to four feet wide and eight inches deep, of any length desired, are the proper proportions, or these may be varied to suit circumstances. Prepare the mixture of loam and manure, making the bed in layers, and pounding down each with the back of the spade. Leave this to heat through for a few days, and as soon as the heat subsides to 90°, make holes in the bed about a foot apart each way, into which put pieces of the spawn two to three inches in diameter; fill up the holes with the compost, and at the expiration of a week or ten days the spawn will have thoroughly diffused itself through the bed. Spread a layer of fresh soil over the heap to the depth of two inches, and cover with three or four inches of hay, straw, or litter. Examine the bed often to see that it does not get dry. When water is given, it should be at a temperature of about 100°.

MUSTARD—MOUTARDE—*Mostaza*—*Senf*.

- 1105 Black, 30 cents $\frac{1}{2}$ quart. | 1108 White London, 40 cents $\frac{1}{2}$ quart.
1109 Chinese Large Cabbage Leaved $\frac{1}{2}$ lb., \$1 00

CULTURE.—Sow thickly during early Spring, in shallow drills, and press the earth well down. For Fall salad, sow in September; or in frames or boxes during Winter, when frost can be partially excluded.

NASTURTIUM—CAPUCINE—*Maranuela*—*Nasturtium*.

- | | $\frac{1}{2}$ lb. | $\frac{1}{2}$ oz. | | $\frac{1}{2}$ lb. | $\frac{1}{2}$ oz. |
|-------------------------|-------------------|-------------------|------------------------------|-------------------|-------------------|
| 1110 Dwarf Yellow..... | \$3 00 | 30 | 1112 Tall Yellow..... | \$1 25 | 15 |
| 1111 Dwarf Crimson..... | 3 00 | 30 | 1113 Tall Blood-colored..... | 1 25 | 15 |

CULTURE.—Sow as soon as all danger of frost is past, in drills about an inch deep. The tall kind requires fences or poles, on which to climb for support. If left to trail upon the ground the fruit is apt to be injured. The seeds are used in flavoring pickles, or as a substitute for Capers.

OKRA—GOMBO—*Quimbombo*—*Safran*.

- 1113½ New Early Improved Dwarf, $\frac{1}{2}$ lb., \$1 50; $\frac{1}{2}$ ounce, 20 cents.
1114 Dwarf Green, $\frac{1}{2}$ lb., \$1 00; $\frac{1}{2}$ ounce, 10 cents.
1116 Long Green, $\frac{1}{2}$ lb., 75 cents; $\frac{1}{2}$ ounce, 10 cents.
1117 Creole Extra Long Pod White, $\frac{1}{2}$ lb., \$2 00; $\frac{1}{2}$ oz., 20 cents.

CULTURE.—Sow late in Spring, after the ground has become warm, in drills three feet apart, where the plants are to remain. Thin out from nine to twelve inches. They should be well manured. They may also be raised in pots, or a hot-bed, and transplanted. The pods, when young, are used for soups, stews; and when cold, made into a salad.

ONION—OIGNON—*Cebolla*—*Zwiebelfn*.

| | | | 1166 Shallot Seed, per packet, | | 20 |

KINDS.—Nos. 1119 and 1120 are small, but the earliest. Nos. 1129, 1135, and 1149 are the best for main crop. Nos. 1120 and 1129 are also best for pickling, but should be sown very thick for this purpose. Nos. 1123, 1125, 1127 and 1157 are the large Italian Onions, well adapted for all of our Southern latitudes. Nos. 1130, 1135, 1138 and 1153 are the celebrated sorts for market. No. 1165, for early Spring Salad.

CULTURE.—Sow in rich, sandy soil, in drills one foot apart, as soon as the ground can be worked in Spring. Thin to three or four inches, using the rake and hoe frequently to keep down the weeds. No. 1165 should be sown early in the Fall, and will produce leaves for Salad early in Spring. Onion Sets and Tops are planted near the surface in drills twelve inches apart and four inches in the rows. These last are valuable for early use, and where Onions from seed cannot be raised the first year.

Those marked * are Wrinkled Marrows, and should be sown thicker than the round Peas, and not till the ground has become warm, as they are more liable to rot. They are the finest flavored of all the Peas.

KINDS.—We recommend for the first crop, Nos. 1200, 1201, 1210, 1220 and 1235; for second crop Nos. 1239 and 1245; for general crop, Nos. 1260, 1265, and 1295, for late crops; Nos. 1306, 1307 and 1320; for small gardens, Nos. 1338, 1346, 1347 and 1350. No. 1339 is one of the finest intermediate sort, and the Peas should be dropped about six inches apart.

CULTURE.—A week may be gained in earliness, by sowing a quantity in moist sand placed in a box in the cellar, and planting outside when well sprouted. Light, dry soil, not over rich, suits the Pea. Sow as early as the ground can be worked, and again every two weeks, for succession, up to the first of June, after which there is danger from mildew. Sow in single or double rows, from four to six feet apart, according to the different heights, about an inch apart in the row, and four inches deep. In Summer, sow six or eight inches deep. Latter part of August sow again Nos. 1200 or 1220 for Fall crop. Hoe often. The tall sorts can be made to bear more freely by pinching in. The dwarf varieties may be grown in beds like Bush Beans, with the rows about the same distance apart.

OXHEART PEPPER.

PEPPER—PIMENT—*Pimiento*—Peffer.

1395 Red Chili	4	00	40	goes)	3 00 30
1396 Yellow Chili	4	00	40		

KINDS.—Nos. 1395 and 1396 are the very small sort used for Pepper Sauce. The others are best for main crop.

CULTURE.—Sow in hot-bed in March, and when the soil has become warm set out in rows two feet apart and eighteen inches in the rows; hoe frequently, and keep down all weeds. The plants may also be forwarded in small pots.

GIANT EMPEROR PEPPER.

POTATO—POMME DE TERRE—Patata—Kartoffel.

The prices may vary as the season advances.

EARLY VARIETIES.

	Bushel.	Barrel.
1400 Beauty of Hebron. <i>Slightly flesh colored skin, with pure white flesh. The best and most popular early variety in cultivation.</i>	\$2 00	\$4 00
1401 Clark's No. 1. <i>Resembles Early Rose, but is more productive and earlier.</i> ..	2 00	4 00
1402 Rose Magnum Bonum. <i>Grows to a large size, deep eyes, of fine table quality</i> ..	2 00	4 00
1404 Rosy Morn. <i>A new edition of Early Rose. Table quality very fine.</i>	2 00	4 00
1406 Early Vermont. <i>An old edition of Early Rose, not distinct</i>	2 00	4 00
1407 Mayflower. <i>Snowflake in form and quality, but much earlier. Skin russeted and netted. Very desirable.</i>	2 00	4 00
1408 Watson's Seedling. <i>Belongs to the Rose family, but more productive</i>	2 00	4 00
1409 Brownell's Best. <i>A heavy cropper, resembles Mayflower, except that the flesh is not quite so white and fine grained</i> ..	2 00	4 00
1410 Telephone. <i>Resembles the above, except that the skin is not so much netted. Table quality very fine</i>	2 00	4 00

Potatoes.—Continued.

	Bushel.	Barrel.
1411 Early Sunrise. <i>The true type of Early Rose</i>	\$2 00	\$4 00
1412 Hall's Early Peach Blow. <i>Very early and grows to a large size</i>	2 00	4 00
1414 Chicago Market. <i>Closely resembling Early Rose, but earlier, excellent quality</i>	2 00	4 00

INTERMEDIATE VARIETIES.

1416 Orange Co. White. <i>Very white flesh and skin. Excellent quality</i>	2 00	4 00
1417 Mammoth Pearl. <i>Snowy white flesh, and mammoth in growth</i>	2 00	4 00
1418 Dunmore. <i>A heavy cropper, and a desirable variety in many respects</i>	2 00	4 00
1419 Jumbo. <i>A large white variety, good quality</i>	2 00	4 00
1420 Pride of America. <i>Resembles Late Snowflake, but is early</i>	2 00	4 00
1421 Rural Blush. <i>Beautiful blush skin, flesh slightly tinged with pink. Cooks dry. A very heavy yielder</i>	2 00	4 00
1422 Jones' Prize Taker. <i>Flesh colored skin, resembles White Elephant</i>	2 50	4 50
1423 Winslow's Seedling. <i>Skin darker colored than Early Rose. Productive</i>	2 50	4 50
1424 Garfield. <i>A very valuable white variety. Skin very finely netted; giving it a beautiful appearance</i>	2 50	4 50
1425 Improved White Rose. <i>A very white variety of the Burbank family</i>	2 00	4 00
1426 White Star. <i>White flesh, fine floury texture</i>	2 00	4 00
1427 Belle. <i>Blush skin, slightly russet, fine grain</i>	2 00	4 00
1429 St. Patrick. <i>White flesh and skin</i>	2 00	4 00
1430 Vermont Champion. <i>White flesh and skin, great cropper, best quality</i>	2 00	4 00
1432 Queen of the Valley. <i>Enormous size and very productive. Exhibition sort</i>	3 00	5 00
1434 Conqueror. <i>Produces an abundant yield of large white tubers of fine quality</i>	2 00	4 00

LATE VARIETIES.

1436 Burbank Sport. <i>A California production. Is more productive than Burbank and of better quality</i>	2 00	4 00
1438 Wall's Orange. <i>An entirely distinct variety. Its flattened form and white flesh makes it especially valuable for baking</i>	2 00	4 00
1440 Late Snowflake. <i>A sport of its prototype. Is more productive and retains all the Snowflake table qualities</i>	2 00	3 00
1442 Thorburn's Late Rose. <i>Still retains a fair proportion of its old time popularity. Has lately been improved and given a new lease of life</i>	2 00	3 00
1444 American Giant. <i>The largest variety in cultivation, not a good table variety, valuable for exhibition</i>	3 00	5 00
1446 O. K. Mammoth Prolific. <i>As its name indicates is of large size, and productive</i>	2 00	4 00
1448 Alexander's No. 1. <i>Very white skin and flesh, of good quality</i>	3 00	5 00
1450 White Elephant. <i>One of our best, productive and first quality</i>	2 00	4 00

CULTURE.—In order to have the best success in growing Potatoes, and to secure a healthy, vigorous growth and a crop free from rot, it is necessary to plant as early as the ground can be got ready. Select a rich soil, and plant in rows three feet apart, and the sets one foot in the rows. To kill the young weeds, run a light steel-tooth harrow over the field lengthwise of the rows. This will allow the crop to get the start of the weeds, besides breaking up all lumps and leveling the ground ready for the cultivator. If wood ashes and plaster can be procured, sow a good dressing over the field after the potatoes are up. If a *very early* crop is desired, it will be necessary to *sprout* the potatoes before planting. Cut the Potatoes into pieces of any size desirable, and place in a warm, light room from four to six weeks before required for planting in the open ground. During this time shoots will start out strong and vigorous, so that as soon as planted they will send out roots and grow much more rapidly than those treated in the ordinary way. Another method is to place the sets in a hot-bed two weeks before they are wanted, and then lift carefully and set out on fresh horse dung, so that the heat will cause them to start at once. If the Colorado Potato Beetle makes its appearance, the vines must be dusted with Paris Green mixed with about eighty parts of plaster, or, what is better, mix the Paris Green in water, two tablespoonfuls to a pail, and apply with a small brush or broom. Taking care to stir the mixture often, or else the Paris Green will settle at the bottom. Two or three applications during the season will usually suffice to clear off all the beetles.

PUMPKIN—**POTIRON**—*Calabaza*—*Große Kürbis*.

1512 Long White Naples....	75	10	1540 Raphanus Caudatus, or Edible Pod Radish...	40	

KINDS.—Nos. 1485, 1486, 1488, 1492 and 1494 are best for early sowing; Nos. 1492, 1499 and 1505 are best for succession. Nos. 1512, 1515, 1518, 1520 and 1528 for Summer sowing. Nos. 1533, 1535 and 1537 for Winter use. No. 1537 is the best sort—keeps like a Turnip.

CULTURE.—Sow as soon as the ground is dry in the Spring, in light, rich soil, in rows eight to twelve inches apart, every week or ten days for a succession, up to the middle of June, after which they are but little used, unless a cool northern spot can be had, where the ground is shaded during part of the day. Sow also in early Fall for late crops and Winter use.

RHUBARB—RHUBARBE—*Ruibarbo*—*Rhabarber*.

1544 Linnæus, 25 cts. p oz., \$1.50 p lb. | Roots, 10 cts. each; \$1.00 p doz.

CULTURE.—Sow seed in a cold frame, in a fine, rich, sandy loam, about the first of March, in drills four inches apart. Keep the frame covered during nights and cold days, so that the soil will not freeze, and in six to eight weeks the plants will be large enough to set in the open ground. Transplant to a rich soil, and set in rows twelve inches apart and twelve inches in the rows. The following Spring transplant again to four or five feet apart each way, and the next Spring the stalks will be large enough to pull. When roots are set out, plant them four or five feet apart each way, and keep the weeds down. If roots are used, a crop may be secured after one season, and this is much better than sowing seeds where only a few plants for family use are needed; in the Fall the bed should have a thick dressing of coarse manure, which is to be spaded under in the Spring.

ROQUETTE.

1546 20 cents p ounce; \$1 50 p lb.

CULTURE.—Sow early in Spring, in rows, and thin out to eight or ten inches. If kept well scuffled and watered, the tart flavor of the leaves is greatly diminished. This flavor is not so pronounced in the small leaves, which are used for Salad. The flowers appearing from May to June, have very much the odor of the orange blossom.

SALSIFY, or Vegetable Oyster—SALSIFIS—*Ostion Vegetal*—*Saferwurzel*.

1548 *Long White*, p oz. 10 cents; p lb. 1.25.

SALSIFY.

CULTURE.—Sow as early as the ground can be worked in Spring, in drills twelve inches apart, one inch deep, and thin out to six inches in the row. Keep them clear from weeds. Cultivate the same as for Carrots and Parsnips. A part of the crop may be left in the ground till Spring, when it will be found fresh and plump. The roots are cut into pieces half an inch long, boiled until tender, and then served with drawn butter, in which way it is a delicious vegetable. They are also mashed and baked like Parsnips, and have a sweet and agreeable flavor. Mashed and fried, the flavor is much like that of the Oyster, and hence the common name of the plant.

SAVOY—CHOU FRISE DE MILAN.

- 1552 Dalmeny Sprouts, Hybrid of Savoy
and Brussels Sprouts p oz. 40 cents.
1554 Feather Stem, a delicious vegetable “ 40 “
1556 New Tom Thumb Savoy, very fine “ 40 “

CULTURE.—Same as for Brussels Sprouts.

SCOLYMUS.1560 25 cents p oz. , \$2 50 p lb.

A vegetable from Spain. The root resembles a small Parsnip, and will keep through the Winter like a Turnip. It is cultivated precisely like the Carrot, except that it should be grown in rows three feet apart and eighteen inches in the rows, and boiled like Salsify.

SCORZONERA—SCORZONERE—*Escorconera*—*Scorzionwurzel*.1561 20 cents p oz. ; \$2 00 p lb.

CULTURE.—Cultivate the same as Salsify. It is cooked in the same manner, but on account of being somewhat more difficult to raise, is seldom seen in cultivation. Considered by many superior to Salsify. It is also called Black Salsify.

SKIRRET—CHERVIS—*Zufterwurzel*.1562 30 cents p ounce.

CULTURE.—Sow in drills half an inch deep and a foot apart and thin out to eight inches in the row. Keep down the weeds. Take up the roots before Winter, and store in sand or earth. A plump, fleshy root, containing a quantity of sugar, and eaten like Scorzonera or Salsify.

SORREL—OSEILLE—*Acedera*—*Sauerampfer*.1564 *Garden*.....10 cents p ounce ; \$1.00 p lb.

CULTURE.—Sow in Spring, in drills eighteen inches apart, in a rich soil, and keep the flower stems cut off as they appear. It remains in the ground year after year, and only needs to be taken up and divided once in four or five years. To be cut and cooked precisely like Spinach; or it is excellent cooked with it, one-third Sorrel to two-thirds Spinach. Very nice to be eaten after it has become cool. Inasmuch as the hot sun tends to increase its acidity, a northern exposure is preferable.

LONG STANDING SPINACH.

SPINACH—EPINARDS—*Espinaca*—*Spinat*. p lb. p oz.

1566 Large Round Viroflay		
or Thick-leaved	\$0 40	10
1570 Round-Leaved	40	10
1573 Curled Leaved Savoy		
or Bloomsdale	40	10
1575 Round Flander	40	10
1577 Long Standing Round		
Thick-leaved	40	10
1577a Prickly	40	10
1578 New Zealand (Summer)	1 25	15

KINDS.—Nos. 1566, 1570, 1573 and 1577 are the best for early Spring sowing; and also for Fall and Winter in this latitude. No. 1577a is the most hardy. No. 1578 is excellent for Summer use.

CULTURE.—Sow in early Spring, in drills a foot apart, every two weeks for a succession; and as it grows, thin out for use. Keep clear of weeds. Sow the New Zealand in hills three feet apart each way, three or four seeds in a hill. This is fit for cutting all Summer. For Fall use sow in August all the other varieties, and for Winter crop in September. Cover that which is left out over Winter with straw or leaves, after the weather becomes quite cold.

SWISS CHARD.

SWISS CHARD, or SILVER BEET.

This is a Beet producing only leaves, excellent as greens. Cultivate like Spinach.

⌔ lb., 75 cents; ⌔ oz., 10 cents.

SPROUTS—CHOUX VERTS NON POMMES.

1582 Spring, or Rape, ⌔ quart, 25 cents.

1584 Winter, or Siberian Kale, ⌔ oz., 10 cents; ⌔ lb., \$0 75

CULTURE.—Sow No. 1582 very early in Spring, and No. 1584 in September.

1646 Fejee Island.....	3	00	30	1700 Strawberry.....	3 00 30
1654 Hathaway's Excelsior... 3 00 30					

KINDS.—Nos. 1619, 1626, 1630 and 1643, are the earliest. Nos. 1619a, 1620, 1621, 1627 and 1631 best for main crop. Nos. 1687, 1690, 1693, 1697 and 1700 for Pickles and Preserves. Nos. 1631 and 1646 are very solid. No. 1700 is the Winter Cherry, sometimes called Strawberry Tomato; it is excellent for Preserves.

CULTURE.—Sow in hot-bed in early Spring, or the seed may be sown in shallow boxes, and placed in a window, where one does not wish to have the trouble of making a hot-bed. Transplant to the open ground when all danger of frost is past, setting the plants three or four feet apart each way. Some support should be provided for the vines to keep the fruit from touching the ground; brush, hay, or anything of the sort will answer the purpose, or they may be tied to stakes.

KINDS.—Nos. 1701, 1703, 1710, 1718, and 1723 are the best for Spring sowing. Nos. 1715, 1717, 1719, 1728, 1746, and 1764 for Fall and Winter.

CULTURE.—For early Turnips, sow as soon as ground opens in Spring. Nos. 1766, to 1776 should be sown from any time in July to 1st of August; but the other kinds, for Winter use, may be sown from middle of July to end of August. Turnips are generally sown broadcast, but much larger crops are obtained (particularly of the Ruta Bagas) by cultivating in drills eighteen inches apart, and thinning to six inches in the drill. One pound to the acre.

GRASS SEEDS.

The best means of improving Meadows, Pastures and Lawns, is to sow a sufficient variety of Grass Seeds, and we trust our numerous customers will give some of the kinds a trial in connection with Timothy, which, by many, is believed to be about the only Grass to be sown.

- Agrostis canina**, *Rhode Island Bent Grass*.—A valuable grass for lawns. For lawns, sow three to four bushels to the acre; for pastures, one to one and a half bushels. See "Formation of Lawns." (12 lbs. to bus.)..... \pounds qt. 25 cents, \pounds bus. \$3 00
- Agrostis stolonifera**, (*Florin*), or *Creeping Bent Grass*.—Valuable as a mixture with other pasture grasses, as it will thrive in moderately moist land on which water does not stagnate. We find it also the best sort for croquet grounds, and small door yards or grass plats. Same quantity as the preceding. (15 lbs. to bus.) \pounds qt. 25 cents, \pounds bus. \$3.00
- Agrostis vulgaris**, or *Red Top Grass*.—A valuable permanent grass as a mixture in either meadows, pastures, or lawns, growing in almost any soil, moist or dry, and standing well our hot climate. Same quantity as above. (14 lbs. to bus.)..... \pounds bus. 1.25
- Fancy Heavy Red Top Grass**, absolutely clean seed..... \pounds lb. 20 cents.
- Aira cæspitosa**, or *Hassock Grass*.—A coarse grass, preferring stiff and marshy bottoms, and thriving well in moist and shady woodlands. In England, door-mats are formed of it by the rural cottagers. 30 lbs. to the acre..... \pounds lb. 18 cents.
- Aira flexuosa**, or *Wood Hair Grass*.—Delights on high and rocky hills; is of little agricultural value except for sheep pastures. 30 lbs. to the acre..... \pounds lb. 18 cents.
- Alopecurus pratensis**, or *Meadow Foxtail*.—One of the very best grasses for permanent pasture, and thrives to perfection on lands of an intermediate quality as to moisture and dryness. It also stands the high Summer heats without burning. 25 lbs. to the acre. \pounds lb. 35 cents.
- Alopecurus agrestis**, *Slender Foxtail*.—An annual late flowering grass. 20 lbs. to the acre. \pounds lb. 20 cents.
- Ammophila arenaria**, or *Beach Grass*.—Valuable on the sandy sea shore, canal banks, &c. It serves, with its tough, widespread, and thickly matting roots, to form natural and permanent embankments. Is of no other agricultural value..... \pounds lb. 50 cents.
- Anthoxanthum odoratum**, or *Sweet Vernal Grass*.—For a mixture with pasture grasses, it is valuable on account of its vernal growth, and also continuing to throw up root foliage until late in the Autumn. For meadows its chief merits are its fragrant odor, which the leaves emit when partially dried, thus sweetening hay. It is a vegetable condiment rather than as a grass of much nutritive value. 25 lbs. to the acre..... \pounds lb. 50 cents.
- " **True Perennial Sweet Vernal Grass**..... \pounds lb. 70 cents.
- Avena elatior**, or *Tall Meadow Oat Grass*.—Most valuable for pastures on account of its early and luxuriant growth; it produces an abundant supply of foliage, which is relished by cattle early and late. 5 bushels to the acre, (13 lbs to bus.)..... \pounds bus. \$3.00
- Avena flavescens**, or *Yellow Oat Grass*.—Will not thrive well when sown alone, but with other species, such as Crested Dogtail, Sweet Vernal, &c., it becomes desirable for dry meadows and pastures. 4 bushels to the acre..... \pounds lb. 70 cents.
- Bromus pratensis**, *Meadow Brome Grass*.—Suitable in mixtures for high and dry meadows. 30 lbs. to the acre..... \pounds lb. 20 cents.
- Bromus mollis**, *Soft Chess*.—Suited to sandy land..... \pounds lb. 20 cents.
- Bromus Schraderi**, or *Rescue Grass*.—Thrives in any soil, but prefers that which is wet, or moist. In England four or five green crops are cut in a year; and every time it is cut another crop shoots from the roots. All kinds of stock eat it freely. 35 lbs. to the acre..... \pounds lb. 30 cents.
- Cynosurus cristatus**, or *Crested Dogtail*.—A valuable grass for sheep pastures, on dry, hard soil and hills. It also belongs to the family of Lawn Grasses. 25 lbs. to the acre. \pounds lb. 45 cents.

- Dactylis glomerata**, or *Orchard Grass*.—Less exhausting to the soil than Timothy, and will endure considerable shade. It blossoms about the same time as Red Clover, making it on that account a desirable mixture with that plant; it is exceedingly palatable to stock of all kinds, and its powers of enduring the cropping of cattle commend it as one of the very best pasture grasses, 3 bushels to the acre. (14 lbs. to bus.) ₧ bus. \$2.00
- Festuca duriuscula**, or *Hard Fescue*.—Not very productive, but it is of a very fine quality, and thrives well in dry situations where many other grasses would fail, thus making it a desirable pasture variety. Thirty lbs. to the acre..... ₧ lb. 20 cents.
- Festuca elatior**, or *Tall Fescue*.—Succeeds best in moist, alluvial and strong clay soils, in shady ravines, and on moist rocky sea-coasts, it is a fortnight later in ripening than *F. pratensis*. Forty lbs. to the acre..... ₧ lb. 35 cents.
- Festuca heterophylla**, or *Various-leaved Fescue*.—A very early grass, native of Germany. A valuable sort for permanent meadows and pastures on high ground. Forty lbs. to the acre..... ₧ lb. 25 cents.
- Festuca loliacea**, or *Spiked Fescue*.—Possesses all the valuable qualities of Rye Grass, and its produce is said to be larger. Thrives best in low meadows and pastures; it starts very early in the season. Forty lbs. to the acre..... ₧ lb. 25 cents.
- Festuca ovina**, or *Sheep's Fescue*.—Grows freely when in high, dry and open pastures. Its chief merit for sheep pasture is that it occupies land which better grasses refuse. Thirty lbs. to the acre..... ₧ lb. 20 cents.
- Festuca pratensis**, or *Meadow Fescue*.—A highly valuable species for permanent grass land. It does not, however, attain to its full productive power till the second or third year when it far exceeds most other sorts in the quantity of its produce and nutritive matter. It is relished by live stock, both in hay and pasture. Forty lbs. to the acre.
₧ lb. 20 cents.
- Festuca rubra**, or *Red Fescue*.—The essential distinction of this Fescue is its creeping roots, which, in dry and sandy soils, are often as strong as those of the common Couch Grass. Well adapted for gravelly banks and dry slopes. Twenty-five lbs. to the acre..... ₧ lb. \$1 00
- Festuca tenuifolia**, or *Slender Fescue*.—Flourishes well on dry and sterile soils. It is well suited for large bleaching greens, lawns, etc. Thirty lbs. to the acre..... ₧ lb. 30 cents.
- Holcus lanatus**, or *Meadow Soft Grass*.—Inferior to many other sorts, but has the merit of easy culture, and accommodates itself to all descriptions of soils, from the richest to the poorest. Four bushels to the acre (7 lbs. to bus.) ₧ bus. \$1 25
- Lolium Italicum**, or *Italian Rye Grass*.—One of the most valuable grasses in Europe, being equally suited to all climates. In England it is considered the best known grass to cut green for soiling, affording repeated large and nutritive crops. We recommend it here for use in pasture mixtures. Three bushels to the acre (18 lbs. to bus.) ₧ bus. \$2 00
- Lolium perenne**, or *English Rye Grass*.—Is the staple grass of Great Britain, entering largely into the composition of many of the richest meadows and pastures. Its natural adaptation to almost all cultivated soils, and its early maturity is the reason it has hitherto been so extensively cultivated in preference to many other equally nutritious sorts. Three bushels to the acre (24 lbs. to bus.)..... ₧ bus. \$2 00
- Onobrychis sativa**, or *Sainfoin*.—A perennial leguminous plant, belonging to the same family as Clover and Lucern, used extensively in France as a Forage plant. Requires a calcareous soil. Four bushels to the acre. A bushel weighs about 26 lbs.
₧ bus. \$3 50 ; ₧ lb. 25 cents.
- Panicum Germanicum**, or *Hungarian Grass*.—One of the most valuable annual soiling plants. It will grow in any ordinary soil, withstands drought well, and in this latitude may be sown as late as the first of July, and produce a large green crop. One and half bushels to the acre (48 lbs. to bus.) ₧ bus. \$1 50
- Phalaris arundinacea**, or *Reed Canary Grass*.—Grows well by the side of rivers, alluvial marshes, ditches, etc. Twenty-five lbs. to the acre..... ₧ lb. 40 cents.

- Phleum pratense, or Timothy.**—A grass so well known needs no description, except that, for a hay crop on moist, peaty, or clay soil, it will produce a larger crop than any other sort. It is not so well suited for light, sandy soils. One-half bushel to the acre.
Price variable.
- Poa aquatica, or Water Meadow Grass.**—This is an excellent pasture grass for very wet situations. Twenty lbs. to the acre..... $\frac{1}{2}$ lb. 35 cents.
- Poa nemoralis or Wood Meadow Grass**—the early growth of this grass in the Spring, and its remarkably fine succulent and nutritive herbage, recommend it strongly for pastures. Thrives well under close feeding. Thirty lbs. to the acre..... $\frac{1}{2}$ lb. 35 cents.
- Poa pratensis, or Blue Grass (Fancy triple—Clean).**—It is also known as *Green Grass, June Grass*, &c., and thrives on a variety of soils (but does best in dry and somewhat shady locations). It requires several years to become well established in the ground as a pasture grass. Very valuable for our Southern States, as it will stand the hottest Summers. One and half bushels to the acre. It is also a most valuable grass for the Lawn; for which purpose, from three to four bushels of clean seed to the acre should be sown. (14 lbs. to bus.)..... $\frac{1}{2}$ bus. \$2 00
- Poa trivialis, or Rough Stalked Meadow Grass.**—The superior product of this grass over many other species, its highly nutritive qualities, and the marked partiality which oxen, horses, and sheep have for it, are merits which distinguish it as one of the most valuable of those grasses which affect moist, rich soils, and sheltered situations. Twenty lbs. to the acre..... $\frac{1}{2}$ lb. 30 cents.
- Reana luxurians, (Teosinte).**—A valuable fodder plant from Central America, resembling, in growth Indian Corn. Well adapted for all of our Southern States. $\frac{1}{2}$ lb. \$2. 00
- Fine Mixed Lawn Grass,** for lawns of any extent. We recommend this mixture sown from three to four bushels to the acre (15 lbs. to bus.)..... $\frac{1}{2}$ bus. \$3.50
- French Mixed Lawn Grass.**—For Croquet grounds, grass plats, &c., this mixture is recommended to be sown from three to four bushels to the acre (15 lbs. to bus.)
 $\frac{1}{2}$ quart, 25 cents; $\frac{1}{2}$ bus. \$4.50
- Bermuda Grass.**—The true variety of the Southern Bermuda Grass. From eight to ten pounds per acre..... $\frac{1}{2}$ lb. \$1.50

FORMATION OF LAWNS FROM SEEDS.

In the first place see that your ground is thoroughly drained and well prepared, sowing at least three bushels of seed to the acre.

Perhaps the best description of soil for a lawn is the stiff loam or clayey soils which predominate in so many districts. This ought not to be by any means too rich, as a rapid growth is not wanted in the grasses of a lawn; but in preparing it for laying down, let the surface be as much alike in quality as possible, and do not stint the quantity of seed. A little white Clover is a useful addition to the seed. A very stiff clay is no better than a very dry sand for resisting drought, as it is in a measure sealed up against the insertion of roots, and the surface contracting by the withdrawal of moisture, it is liable to crack, etc., to a great depth. Nevertheless, a stiff soil usually makes the best lawn.

If your ground is in condition to raise a good crop of potatoes, it will make a good lawn, adding about half a ton of Bone Dust to the acre, harrowed in before sowing the seed. The success of establishing a good lawn depends much on the season and the condition of the ground at the time of sowing. A very slight raking in will protect the seed much, or a sowing of wood ashes will render them distasteful to birds. Rolling, however, is at all times indispensable.

The best time to sow Lawn Grass Seed is early in the Spring, or about the latter part of August. We prefer the Early Spring.

One important thing ought not to be forgotten in the preparation of the ground. Let it all have a surface of about six inches alike, for nothing looks worse than to see a lawn grow all in patches. One exception, however, may be mentioned, and that is, if there be any steep slopes facing the south, or other exposed places, let the earth on them be better and deeper than on the ground level, for the aspect, and other causes, render such places liable to burn with less sun than level places. They ought, therefore, to be of a better material, and sod ought to be provided to lay there if accuracy be expected. When the grass becomes well established, it should be frequently cut. The oftener you mow, the finer your grass will be.

It is proper here to observe that no lawn can be maintained long in good order without successive rollings. Mowing alone will not secure a good bottom without that compression which the roller tends to give. The rolling should be done in the spring before the ground becomes dry.

CLOVERS.

- Alfalfa** (Lucerne).—This is the same as Lucerne. It requires a deep, rich soil, and in such will produce several crops every season, one of the best green fodder plants. Ten to fifteen lbs., to the acre..... ₤ lb. 25 cents.
- Alsike Clover**, *Trifolium hybridum*. Resembles in growth, duration, &c., the Red Clover, thrives well in cold, wet and stiff soils. Ten lbs. to the acre..... ₤ lb. 35 cents.
- Bokhara Clover**, *Melilotus alba*.—A most valuable sort for soiling. It grows from three to five feet high and if sown in rich soil, may be cut three times during the Summer and Fall; lasts two years, or more if cut before flowering although an annual. Ten lbs. to the acre..... ₤ lb. 50 cents.
- Crimson Clover**, *Trifolium incarnatum*.—An annual with rich crimson flowers. Sown at the last of Summer or early Autumn, it furnishes a very early green fodder; excellent for soiling. 20 lbs. to the acre..... ₤ lb. 18 cents.
- Large Red, or Pea-Vine Clover**, *Trifolium pratense* variety for plowing under. Price variable.
- Medium Red Clover**, *Trifolium pratense*. Is a perennial, but of very few years duration, is considered the most nutritious of all species and most valuable in moist locations. Price variable.
- Perennial Clover, or English Cow Grass**.—Extensively used in England, ten to fifteen lbs. to the acre..... ₤ lb. 25 cents.
- White Clover**, *Trifolium repens*. Valuable for lawns and pastures..... ₤ lb. 35 cents.
- Yellow Trefoil**, *Medicago lupulina*.—May be cultivated either alone or with other grasses. Requires about the same treatment and soil as Clover. Although thriving in dry and inferior soils. It sprouts very early in Spring, is of excellent quality, and considered a fine pasture for Sheep. Fifteen lbs. to the acre..... ₤ lb. 20 cents.

BIRD SEEDS, &c.

GRAINES POUR LES OISEAUX.

Prices variable—By the Quart or Bushel.

- Canary**, *Phalaris Canariensis*..... ₤ bushel \$3 00, ₤ qt. 20 cents.
- Hemp**, *Cannabis sativa*..... “ 2 50, “ 20 “
- Lettuce Seed**..... ₤ oz., 10 cents, ₤ lb. 40 “
- Maw** (Blue Poppy), *Papaver Rhœas*..... “ 20 “
- Millet** (American), *Panicum miliaceum*..... ₤ qt. 20 “
- “ (White French)..... “ 30 “
- “ (Red French)..... “ 30 “
- “ (Yellow German)..... “ 20 “
- Rape** (English), *Brassica Napus*..... “ 20 “
- “ (German), “ “..... “ 20 “
- Rough Rice**, *Oryza sativa*..... “ 20 “

Prepared Food for Mocking Birds, ₤ bottle, 35 cents.

Gravel for Cages, ₤ quart, 6 cents.

Esculent Roots and Plants.

Plantes et Racines Potageres.

- Asparagus Roots**, Conover's Colossal (two years old)..... ₤ 100, \$1 00; ₤ 1,000, \$8 00
- Chive Plants**..... ₤ bunch, 25
- Discorea Batatas**, or Chinese Yam..... each, 15 cents; ₤ dozen, 1 50
- Horse-radish Roots**..... ₤ 100, \$1 00; “ 25
- Jerusalem Artichoke**..... ₤ bushel, 3 50; ₤ qt. 25
- Rhubarb Roots**..... each, 10 cents; ₤ dozen, 1 00
- Sea Kale Roots** (strong)..... “ 1 25
- Tarragon Plants** (ESTRAGON)..... each, 30 cents; “ 3 00
- Prickly Comfrey Sets**..... ₤ lb. 50
- Chufas or Earth Almond**..... “ 40

MISCELLANEOUS SEEDS.

Asperula odorata (Waldmeister).—This celebrated perennial plant, growing about six inches high, bears a small white and very fragrant flower; succeeds in almost any soil. In Germany it is thought much of as imparting a certain bouquet to Rhine Wine when compounded with it, making a beverage commonly known as <i>Maitrank</i> .	
.....	p pkt. 10 cents.
Beans (common Horse Beans).....	p 100 lbs., \$8.00. p lb. 10 cents.
“ <i>Soja hispida</i> (Soja Bean).—Resembling a bean, the haulm is stiff and the pods are produced in clusters of from two to five, and contain each four smooth oval nankeen colored seeds. This plant is said to thrive well in hot and dry weather.	p 100 lbs. \$15.00. p lb. 20 cents.
Broom Corn (Long Brush Evergreen).—Broom Corn succeeds in a good deep soil, fresh but not damp. Very sensitive to cold.....	p bush. \$3.00 p qt. 25 cents.
“ (Improved Dwarf).....	“ 5.00 “ 25 “
“ (California Golden Long Brush).—Grows from 12 to 14 ft. high.....	“ 5.00 “ 25 “
Buckwheat, <i>Fine Silver Hull</i> (48 lbs. to bush.).....	\$1 50
Caper Tree, <i>Capparis spinosa</i>	p paper, 25
Caterpillars.—A curious, though by no means an ornamental plant. Of interest only on account of its curious fruit, from which its name is derived. Much fun is caused by mixing them in salads.....	p paper, 10 cents.

Miscellaneous Seeds—Continued.

- Chicory Seed.**—Large rooted, a perennial plant, remaining five or six years in the same soil, provided it is cut before flowering. It may be cut four or five times during the same season, and furnishes an excellent green fodder. Sow broadcast in Autumn or Spring, either alone or with any kind of Clover. Sown in drills, the roots become well developed. When they are dried, roasted, and ground, they become the Chicory of commerce, and are used in adulterating Coffee. $\frac{1}{2}$ oz. 10 cents; $\frac{1}{2}$ lb. \$1 00
- Cotton, Sea Island.** $\frac{1}{2}$ 100 lbs., \$10. $\frac{1}{2}$ lb. 15 cents.
 “ Tennessee Upland “ “ 10. “ 15 “
- Dhoura** (Guinea Corn) See Sorghum.
- Esparto Grass** (*Stipa tenacissima*).—The *Stipa tenacissima* is the true Esparto Grass extensively grown in Spain and other parts of the Mediterranean countries for making ropes, etc. $\frac{1}{2}$ oz. \$1 50
- Fenugreek.**—An annual plant, and very fragrant; of but little use, though, as fodder. The seed is often sought by hostlers to give a temporary fire and vigor to their horses. It is frequently given to oxen and pigs when fattening, causing them to drink and digest their food. Considered to be good for soiling when green. . . . $\frac{1}{2}$ lb. 75 cents.
- Flax Seed.** $\frac{1}{2}$ qt. 25 cents.
- Hop Seed.** $\frac{1}{2}$ oz. \$1 00
- Indigo Seed, Indigofera tinctoria.** $\frac{1}{2}$ lb. \$3.00; $\frac{1}{2}$ oz. 30 cents.
- Jute Seed.**—An annual plant. In Bengal the fibers of this plant are used for making the coarse sacks in which coffee and sugar are packed. A coarse kind of wearing apparel is also made of it. It is cultivated quite extensively in the East Indies, China and Japan, and is now extensively sown in our Southern States. It thrives in any good corn ground. Sow in drills about eight inches apart, four pounds to the acre. Requires no cultivation, as it will outstrip in growth any and all weeds. May also be sown broadcast, from six or seven pounds to the acre. . . . $\frac{1}{2}$ oz 20 cents.
 $\frac{1}{2}$ lb. \$1 25
- Lupins, Blue.**—Used for about the same purposes as the yellow variety; but, as yet, not so popular. $\frac{1}{2}$ 100 lbs. \$10.00, $\frac{1}{2}$ lb. 20 cents.
- Lupins, White.**—One of the best plants known for soiling. It may be sown from April to July, and plowed under when in flower. The seed when burned is an excellent manure for orange and olive trees. $\frac{1}{2}$ 100 lbs. \$12.00, $\frac{1}{2}$ lb. 20 cents.
- Lupins, Yellow.**—Less thrifty than the white variety, but still having an advantage over it in remaining green for a longer period. It succeeds well in the poorest soil; and many lands formerly poor have had their value greatly enhanced by plowing in this Lupin as a manure. $\frac{1}{2}$ 100 lbs. \$10.00, $\frac{1}{2}$ lb. 20 cents.
- Madder** (*Rubia tinctoria*).—A perennial plant, the roots of which, when dried and reduced to powder, furnish a red coloring matter. If cut the second year when in flower, it furnishes a very good green fodder. $\frac{1}{2}$ lb., 75 cents.
- Osage Orange** (*Maclura aurantiaca*). $\frac{1}{2}$ qt., 50 cents; $\frac{1}{2}$ bus., \$7 00
- Pearl Millet** (*Penicillaria spicata*).—A valuable fodder plant for the South. Sow in drills eighteen inches apart, and eight to ten pounds to the acre. $\frac{1}{2}$ lb. 30 cents.
- Poppy, Opium.**—Its seed furnishes about 35% of an agreeable sweet oil, good for eating, painting, and illuminating. May be sown in Spring, either broadcast or in drills, covering with but little earth. It is also cultivated for Opium. $\frac{1}{2}$ oz., 25 cents; $\frac{1}{2}$ lb., \$1 50
- Ramie** (*Urtica tenacissima*).—A perennial plant producing a very fine thread called “Tschou ma.” The Chinese make a fine soft cloth of it, called A-poo or Summer-cloth. It requires a deep, rich soil, and succeeds best in the South. $\frac{1}{2}$ oz., \$1 50
 “ *Urtica nivea*.—Silvery China Grass. $\frac{1}{2}$ oz., \$1 00
- Reana luxurians** (*Teosinte*).—A valuable fodder plant from Central America, resembling in growth, Indian Corn. Well adapted for all of our Southern States. . . . $\frac{1}{2}$ lb., \$2 00
 $\frac{1}{2}$ oz., 25 cents.

Miscellaneous Seeds—Continued.

- Scurvy Grass**—used as Pepper Grass. $\frac{1}{2}$ oz., 25 cents.
- Seradella**—A fine fodder, of good quality, admitting of one, and sometimes two cuttings in one season. It succeeds well in a dry, sandy soil, and furnishes a good pasture for sheep. $\frac{1}{2}$ lb., 40 cents.
- Snails**—Used the same as Caterpillars. $\frac{1}{2}$ paper, 10 cents.
- Sorghum**—Rural branching, (also called "millo maize" in some sections). This differs from all other Sorghums. Its great merit and distinction is, that when cut for feeding it starts again from the remaining stumps with renewed strength and vigor, thrives in the hottest and driest localities. $\frac{1}{2}$ 100 lbs. \$15. $\frac{1}{2}$ lb., 25 cents.
- " White seeded, Dhoura or Guinea Corn. " 20. $\frac{1}{2}$ lb., 25 cents.
- " Amber Sugar Can. " 8. $\frac{1}{2}$ lb., 15 cents.
- " Honduras " " 12. $\frac{1}{2}$ lb., 15 cents.
- " Stewart's Hybrid. " 12. $\frac{1}{2}$ lb., 15 cents.
- " Chinese " " " 15. $\frac{1}{2}$ lb., 25 cents.
- " Red Imphee. " 12. $\frac{1}{2}$ lb., 15 cents.
- " Halepense (Johnson Grass) one of our most valuable southern fodder plants and only recently discovered to be perfectly hardy in New Jersey. It is a rapid growing perennial. On rich soils it may be cut from three to four times in a season. The best results are obtained by sowing the seed in August and September at the rate of 25 lbs. to the acre. $\frac{1}{2}$ 100 lbs. \$18 00; $\frac{1}{2}$ lb. 25 cents.
- Spurry** (*Spergula arvensis*)—Small annual plant, succeeding best in fresh sandy soil. It can be used in a green state, or for hay. Butter made from the milk of cows fed on this is considered of a superior quality in Belgium and Holland. It serves a useful purpose, growing luxuriantly on indifferent land. Should be sown from March to May, 15 lbs. to the acre. $\frac{1}{2}$ 100 lbs. \$15. $\frac{1}{2}$ lb., 20 cents.
- Sun Flower**, Large Russian. $\frac{1}{2}$ qt., 25 cents; $\frac{1}{2}$ bushel, \$5 00
- Teasels**, Fuller's—The heads, furnished with sharp, barbed spikes, are used for combing cloth. They require a good deep soil, and should be sown about April or May. In the South they may be sown in the Fall. The young leaves are often used for feeding silkworms. $\frac{1}{2}$ 100 lbs. \$15. $\frac{1}{2}$ lb., 20 cents.
- Vetches**, Spring—Sown broadcast like Wheat or Barley, and sometimes mixed with Oats for soiling. Used in France and Canada as a substitute for Peas. Also ground up into Flour, after which it is mixed with Wheat Flour for making bread. $\frac{1}{2}$ bushel, \$3.50; $\frac{1}{2}$ qt., 25 cents.
- Wild Rice** (*Zizania aquatica*)—A native of our Northern and Western States. Valuable as a forage plant for swamps and inundated land. Stock of all description are fond of it when green, and also when cured for fodder. $\frac{1}{2}$ lb., 35 cents.
- Worms**—Used the same as Snails and Caterpillars. $\frac{1}{2}$ paper, 10 cents.

Tree & Shrub Seeds.

ABIES DOUGLASSII.

In order to preserve seeds of CONIFERS and other *Evergreen Trees*, it is best to keep them in perfectly dry sand until the time of sowing ; if this cannot be done readily, place them in a cool, dry spot, where mice will not reach them. For this latitude, the Seeds should be sown thinly, as early in the Spring as the ground can be worked, in beds of fine sandy loam. Cover to the depth of about the thickness of the Seed, and press the beds gently with the back of the spade to firm the

earth around the seeds. Great care must be taken not to give too much water, as the young plants damp off very easily. Water with a very fine rose, but never so that the ground becomes *soggy*. Some shade must be used to protect the young plants from the hot, drying sun and winds, and also to keep the birds from destroying them. Seeds of the rarer sorts may be sown in cold frames or in boxes : if in cold frames, the sashes should be shaded and the frame raised at the corners three or four inches, to allow the air to circulate freely. Keep the young plants well weeded, and allow them to remain from one to two years before transplanting.

The propagation of **Deciduous Trees** from Seeds is less difficult than that of the *Evergreen Species*, a little attention only being required to sow at the proper season to insure success. **Acorns, Chestnuts and Walnuts** should be planted in Autumn, or kept during the Winter in sand or moss. They shrivel up by too long exposure to the air,

and many of them lose their power of vegetating entirely, those with hard shells like the **Locust, Gymnocladus, &c.**, should also be planted in Autumn, or placed in boxes with sand and exposed to frost before planting, otherwise they may not vegetate till the second year after planting, but if these seeds are received too late in the Spring to expose them to the action of frost, they may be put into a vessel of hot water for an hour or so before planting. **American Elm, Silver Maple**, and a few other sorts, ripen their seeds early in the Summer, and, if gathered and planted soon after they fall from the tree, will make fine plants the same season. The seeds of other **Deciduous Trees** and Shrubs should be planted from the middle of April to the middle of May, in drills about two feet apart, and covered about half an inch in depth, according to size.

**Indicates that it is not hardy in this latitude.*

FLOWER * SEEDS,

—WITH—

Practical Directions for their Culture, Treatment, &c.

HARDY ANNUALS (*h.A.*)—Sow in April or May, according to the latitude, in shallow boxes or pots placed in a warm window, a hot-bed, or, if possible, in a green-house. A second sowing ought to be made from two to four weeks after for a succession, as well as to provide against failure the first time. For sowing seeds in, there is nothing better than shallow boxes from two to three inches deep, and of any convenient size. The proper soil in which to sow seeds of all the smaller kinds should be a very fine, rich, sandy loam; if some fine charcoal can be mixed with it, it will be beneficial. The soil from old hot-beds is excellent, or sods from an old pasture piled up and allowed to rot for two or three years, and then mixed with a little fine old stable manure and sand. The selection of a proper soil in which to sow fine seeds is very important, as upon this depends the success or failure of them. After the seeds are up, care must be taken to give them plenty of air and moisture, and yet not too much water, or they will damp off. When the young plants are well out of the seed leaf, they must be transplanted to new boxes. If pots two inches or more in diameter can be had, set out from three to a dozen or more of the young seedlings around the edges of the pots, so that as soon as the ground is warm enough they may be easily turned out and planted singly, as by that time they will have made good roots. Where the pots cannot be had, boxes, tin cans, etc., may be substituted, or a cheap and effective plan is to take out the inside of a potato or turnip, leaving a shell half an inch thick. After filling these with the compost above referred to, set out the seedlings in them, and place the whole in boxes, filling in the spaces between the potatoes or turnips with soil. When the plants are ready to set in the open ground it is an easy matter to transplant them, and as the decay of the turnips or potatoes affords nourishment to the young plants, a double purpose is served in using them. A common mistake in sowing Flower, as well as other seeds, is in covering too deep. As a general rule, cover only to the depth of the thickness of the seeds, or with medium-sized seeds like Balsams, Zinnias, etc., a half an inch or so is none too much. Such fine seeds as Portulacas need only to be pressed into the soil with a piece of board or the palm of the hand. Always press the earth down firmly after sowing all Flower seeds, else there is danger of their drying up before the roots can get firmly hold of the soil. Seeds of the hardier *Annuals* may be sown where they are to grow, but, as a rule, it is preferable to transplant, as the plants are generally stronger and stand the drought better. During very dry weather, and when the seedlings are first set out, they should be watered frequently. Provide some support for all such *Annuals* as require it, else the plants become weak and straggling, and do not make the show they otherwise would.

The weeds should be kept down and the ground loosened often, so that the plants will receive the full benefit of the rains and dews, which they will not if the ground is allowed to become hard and baked.

Seeds of *Biennials* and some *Hardy Annuals* may be sown in September in boxes and placed in cold frames. They will make fine strong plants by Spring, and come into flower early. Do not put on the sashes until heavy rains and frosts render this necessary, and then always remove during the day, and whenever the temperature is above freezing in Winter.

HARDY BIENNIALS AND PERENNIALS (hB and hP.)—These require the same treatment as the *Hardy Annuals*. In addition to the above, both *Hardy Biennials* and *Perennials* may be sown in the open border in September; for if not sown until Spring, the seeds of many *Perennials* require two years before they germinate. In this case it is a good plan, at the commencement of frost, to cover them lightly with straw, leaves, or any dry litter, in order to afford some protection from the extreme severity of the Winter. As soon as the frost is out in Spring, the covering must be carefully removed and the surface around them loosened, and, when large enough, transplanted to the flower garden where they are to remain.

HALF HARDY ANNUALS (hhA.)—These may be sown in shallow boxes, pots, or a hot-bed, as directed for *Hardy Annuals*. They may be sown thus at any time after the middle of April, as the hot-bed will be sufficient protection; but it is best to cover the glass with a mat or straw at night until danger of frost is past. In the day give all the air possible by partly or wholly removing the lights. After the end of May sow in the border, like *Hardy Annuals*.

Half Hardy Biennials and *Perennials* require the same treatment. Though plants and their bloom are greatly forwarded by sowing the seed early in boxes under cover, it may be stated that nearly all kinds of hardy and half hardy flower seeds may be sown in the open border, in a warm and sunny spot, as soon as the soil has become dry and warm; so that those who have no glass frames or green-houses need not be without flowers. They can have them, but it will be later.

TENDER ANNUALS, BIENNIALS, AND PERENNIALS.—The best method to obtain an early bloom of the *Tender Annuals* (tA), and to insure strength to the plants, is to sow the seeds in boxes or pots in March, placing them in a warm green-house, or plunging in a moderate hot-bed, carefully protecting them from the cold, shading from the mid-day sun, and watering with a fine rose. The seed should be sown in very light, sandy compost, and the pots well drained by placing broken pots and bits of sods in the bottom. The finer seeds must not be covered more than an *eighth of an inch deep*, and the soil pressed down closely over them. Water frequently, particularly if the house or hot-bed be very warm. As soon as the plants are out of the seed leaf, transplant into shallow boxes or small pots, and when they have acquired sufficient strength transplant into the flower beds; not, however, before the middle of May.

GREEN-HOUSE SEEDS (g.)—Should be sown as directed for *Tender Annuals*, in pans, pots, or shallow boxes, and be kept in the house, carefully watched, slightly watered occasionally, and sheltered from the hot sun till strong enough to transplant. Most varieties may be sown at any season of the year.

The smaller seeds of *Green-house Plants* are sometimes difficult to germinate, unless great care be taken in the mode of sowing. Hence the supposition is produced that the seed itself is not good, whereas the fault is not in the seed, but in the treatment. Fine seeds of this description should be sown in leaf-mould or peat, with some fine sand added to it; press firmly down in the seed-pan or pot, and make perfectly level at the top, so that the mould may not afterward sink materially with watering. Sow the seed very thin, and cover *very lightly* with a little of the compost, or with some of the silver sand. Success is more certain if a pane of glass be placed over the pan or box till the plants have appeared, when it should be removed. By this method the difficulty of success with fine seeds will be removed. As soon as the young plants have two leaves, they should be transplanted into similar compost in another pan or box. To do this, do not pull them out of the seed-pan, but break up the soil by running a stick or the trowel under it, when the plants can be taken out with good roots. After transplanting, they should be kept in a shady part of the green-house for a few days, until they are established in the new soil.

There are many minute plants, from the finer seeds, killed by drenching with water while very young. One way to avoid this is to give the water by dipping a clothes-brush in water,

shaking off the greater part of the water from the brush, and then (holding the brush over the seed-pan) drawing the hand over the bristles several times, which will cause the water to be thrown on the young plants almost like dew. Some of the vaporizers now in use are admirably adapted for watering tender young plants. In the first stage of their existence, plants require moisture in a minute quantity, often repeated, and not in such large quantities as to saturate the soil in which they are growing.

PRIMULAS, CHINESE.—The Chinese Primrose is deservedly one of our most popular winter-blooming plants. For winter use, it is easily raised from good seed, if these be sown at the right time and properly treated. Sow the seed in drills in a light, rich soil in shallow boxes at any time from the middle of March till the middle of May. The earliest sown seed will naturally produce the earliest bloom. Cover the seed about an eighth of an inch, and press the soil on them with a board or the bottom of a pot. Water moderately, avoid forcing the seed, and keep the young plants away from drip. The boxes may be placed in the green-house, or out of doors in a frame. As soon as the plants are well out of the seed leaf, transplant them singly into two or two and a half inch pots, using a light, rich soil. The object now is to make good stocky plants, and they must therefore be re-potted as often as the pots become tolerably filled with roots, until they are in five or six inch pots, when they may be allowed to flower. Previous to this, any flower stalks that appear must be pinched out. In a suitable place the plants will do better out of doors than in the green-house during the summer. They need a liberal supply of water. The plants will bloom continuously during the winter in either the green-house or a well-lighted sitting room.

CINERARIAS.—Years ago the Cineraria was a popular plant among florists. Bedding plants crowded it aside; but it is now fast taking its proper place again among choice winter-blooming plants. It is, to be sure, a rather difficult plant to grow and bloom well, if its requirements are not understood. The mistake generally made is in growing it in a warm house instead of a cool one. The seed should be started in the green-house. For winter blooming, sow the seed in April and May in shallow boxes in fine soil. Sow the seed in shallow drills, cover, and press the earth rather firmly with a piece of board or the bottom of a pot. Set the box where it will get the morning sun, but be free from drip. Water moderately and carefully. The treatment of the seedlings is similar to that given to the Chinese Primrose. As soon as the plants are out of the seed leaf, transplant singly into small pots in a rich soil with some vegetable mould in it. Re-pot as often as the pots become moderately filled with roots, or sufficiently often to prevent the roots from becoming pot bound, and so avoid checking the growth. If specimen plants be wanted, the re-potting should be continued till the plants are in pots from eight to ten inches in diameter. The last two pottings should be liberal ones, and drainage well provided for, as the plants will need copious waterings. When the flower stalks appear, manure water may be used once or twice a week. Aphid and red spider are the chief enemies to be guarded against; and this is best done by frequent syringings overhead. The plants will do best during the summer out of doors in some place where they will not get too much sun, and be free from the drip of trees. In the fall the plants should be placed in a *cool* green-house, where the temperature can be kept low and the air moist. The plants should be placed on a table by themselves, and the pots *always* kept far enough apart to prevent the leaves in one pot from touching those in the next. In the winter, when the plants are coming into bloom, it may be necessary to smoke the plants occasionally to keep down the green fly.

CALCEOLARIAS—The herbaceous varieties of the Calceolaria are very beautiful and popular plants. They should be flowered in a cool green-house. The seeds are very small, and should be sown on the surface. Sow in shallow boxes filled with a light, sandy soil that has been sifted. Sow moderately thick in rows on the surface, and cover very lightly with sifted sphagnum moss, coconut waste, or very light soil. Press the soil firmly on the seed. The watering should be done carefully. An atomizer or brush may be used to ad-

vantage. To retain the moisture, the box may be covered with panes of glass, which must be removed, however, as soon as the plants make their appearance. The box should have plenty of light, but not much sun. As soon as the plants can be handled, transplant singly into pots two to two and a half inches in diameter. The soil should be light and rich, and vegetable mould is an excellent addition. Re-pot as often as the pots are fairly filled with roots, and continue the re-potting, if fine flowers are wanted, till the plants are in pots eight inches in diameter. If the pots become root bound, the plants are apt to run prematurely into flower. Water regularly and abundantly, to prevent drooping. As the pots increase in size, drainage must be supplied to carry off the surplus water. Place in a *cool* green-house in the winter, as directed for Cinerarias, and keep the pots sufficiently apart at all times to prevent the leaves from touching. An occasional smoking may be necessary to keep down the green fly.

GERANIUMS.—The Scarlet or Horseshoe Geranium, (or, more properly, Pelargonium,) now so extensively used for bedding, may be easily grown from seed at any season of the year. If during the summer, better out of doors than any where else; but in a green-house or sitting room during the winter. Sow the seed in pots or shallow boxes, in any common soil. Cover about an eighth of an inch, and press the soil on the seed. Transplant as soon as out of the seed leaf in small pots, in a soil only moderately rich, or, if the seed were started out of doors, the plants may be put in the border. Seed sown indoors in the fall or early winter, and the plants grown in the green-house, will show flowers in June and July, while plants from those sown in March or later will not come into flower till August or September, and some even later. Much, however, depends upon the treatment, those receiving special care in pots blooming much sooner than those turned into a border or bed. The character of the flower will depend upon the goodness of the seed. While many will produce bright and pretty flowers, it is only occasionally that one will be found sufficiently good to save for a name, except the seed has been saved from choice kinds.

Novelties and Select New Flower Seeds.

- | | |
|---|--------|
| Acroclinium albo flore pleno. <i>New double white variety of this pretty Everlasting, producing about the same percentage of double flowering plants as the double rose variety</i> | |
| <i>Per packet.</i> | \$0 40 |
| Aquilegia cœrulea hybrida. <i>One of the most beautiful perennials, violet, blue and yellow flowers.</i> | |
| <i>Per packet.</i> | 25 |
| Calendula sicula flore pleno. <i>"Double Sicilian Marigold." Beautiful annual, with round, well shaped, double orange yellow flowers.</i> | |
| <i>Per packet.</i> | 10 |
| Candytuft, <i>"New Giant White." Very large flowers and truss, a new valuable strain for florists.</i> | |
| <i>Per packet.</i> | 10 |
| Celosia plumosa aurea, <i>"Golden Feathered Cockscomb." A most beautiful strain, exquisite shades.</i> | |
| <i>Per packet.</i> | 10 |
| Chrysanthemum carinatum, <i>"Eclipse." New variety resembling in form of flower the well known Chrys. car. Burridgeanum, but surpassing it greatly by its striking colors which are pure golden yellow with a bright purplish scarlet ring or centre on the ray florets, the disk being dark brown. For cut flowers this variety will be found very valuable and attractive.</i> | |
| <i>Per packet.</i> | 40 |

- Chrysanthemum coronarium sulphureum flore pleno.** For bouquets or for general decorative purposes, this new double variety of the annual Chry. will be found most desirable, the color of the flowers are delicate lemon. Per packet..... \$0 30
- Dahlia, "New Single."** We again call attention to this magnificent decorative plant. The style of the flower is entirely distinct from the ordinary Double Dahlia, easily flowered from seed the first year by starting them in hot bed—cannot be too highly recommended. Per packet..... 10
- Daisy, "Longfellow" (Bellis perennis flore pleno).** Extra large double dark rose colored flowers, will become very valuable for bouquets. Per packet..... 50
- Eucharidium Breweri.** Rare and truly magnificent species of dwarf spreading habit and narrowly lanceolate foliage. The color of the flower is a pleasing purplish rose shading to white in the centre. It flowers very profusely and is of the same easy culture as the different kinds of Clarkia. Per packet..... 40
- Lavatera arborea variegata.** This beautiful species has met with great success. The variegation of its large leaves consist of a mixture of different shades of green and pure white, it becomes most striking as the plants advance in age, valuable for large beds or for single lawn plants. Per packet..... 25
- Mignonette "Machet."** Well adapted for pot-culture, it comes perfectly true from seed which, however, is not at all abundantly produced. The dwarf and vigorous plants are of pyramidal growth and furnished with very thick dark green leaves; they throw up numerous stout flower-stalks terminated by massive spikes of deliciously-scented red flowers. It is entirely distinct from all the sorts hitherto. Per packet..... 25
- Mignonette, "Golden Queen."** Large flower and valuable for florists. Per packet..... 5
- Mignonette, "Crimson Queen."** Large flower and valuable for florists. Per packet..... 5
- Nasturtium, "Empress of India."** The flowers of this grand novelty in the way of Dwarf Nasturtiums, are of a brilliant crimson color, and so freely produced, that no other annual in cultivation can approach it in effectiveness, the leaves are a bluish green and quite distinct. Per packet..... 10
- Pansy, "Trimarceau."** An entirely distinct and beautiful new race. The plants are of a vigorous though compact habit; the flowers are carried well and each one is marked with three large blotches or spots. They are of refined form and present a notable difference from those of all known races in being of a size hitherto quite unattained in this genus. Per packet..... 50
- Papaver Inephisto.** New single flowering Poppy, a sport out of Papaver, "Danebrog." The color of the flowers is a fiery deep scarlet bearing on each of the four petals a large blackish violet spot; very showy variety. Per packet..... 25
- Peas, Sweet Pea, "Princess Beatrice."** A new and lovely variety, distinct from any other with respect to color, which is a rosy carmine, delicately shaded with lighter and darker tints. Per packet..... 5
- Petunia hybrid nitus aurea.** An entirely new strain from Germany, large and beautiful veined flowers and deep yellow throat. Per packet..... 40
- Primrose, English Yellow Primrose.** Seed of this celebrated flower can rarely be had. Per packet..... 25
- Trachymene cœrulea albo.** New white flowering variety of this charming annual, highly recommended. Per packet..... 30
- Verbena hybrida foliis aureis, "Golden Leaved Verbena."** Very interesting and attractive new variety with bright golden yellow leaves and flowers of the purest scarlet, forming thus a beautiful contrast and being admirably adapted for bedding purposes. Per packet..... 30

EXPLANATION

OF THE

FLOWER SEED CATALOGUE.

The first column gives the number by which the different varieties may be ordered without writing out the whole name.

The second column gives the *Botanical* name, in Roman characters.

* designates ornamental leaved plants.

.. .. in all cases, *Repetition*.

in vars.. in *varieties*, or mixed colors.

fl. pl. .. *flore pleno*, or double flowered.

The figures in the third column give the comparative time of *Flowering*. As it is impossible, in our varied extent of climate, to state the exact month any plant may flower in, we have adopted the simple plan of classing the different varieties into EARLY, INTERMEDIATE, and LATE flowering sorts. Thus:

No. 1 designates *early*.

No. 2 .. *intermediate*.

No. 3 .. *late-flowering plants*.

The fourth column gives the *Hardiness and Duration* :

A represents *Annual*, lasting but one year.

B .. *Biennial*, .. two years.

P .. *Perennial*, .. three or more years.

E .. *Evergreen*.

But as a large number of the Biennials and Perennials, if sown early, flower the first season, this distinguishing mark † is affixed to such :

h. represents *hardy*—plants for open borders.

hh. .. *half hardy*—plants that require to be forwarded in pots or frames.

t. .. *tender*—requiring protection.

g. .. *green-house plants*.

bu. .. *bulbous plants*.

S. .. *shrubs*.

The fifth column gives the color in full, except as abbreviated below. Thus :

ap. . . apetalous,	bff. . . buff,	lav. . . lavender,	scar. . . scarlet,
blk. . . black,	car. . . carmine,	ptd. . . painted,	spot. . . spotted,
br. . . brown,	cr. . . crimson,	pur. . . purple,	stri. . . striped,
tri. . . tricolor,	sul. . . sulphur,	var. . . variegated,	ver. . . vermilion.

The sixth column gives the comparative height of the plants in feet. *Trail*. signifies *trailing*; *Cr.* *creeping*.

The seventh column, the price ₧ packet.

3436 Blue Spanish	1 2	5		
3438 White Spanish	1 2	..	white	..	5		
3444 Lupinus albus	2 3	2	5		The <i>Lupin</i> family, annual or perennial, are among the most beautiful ornaments of the garden. Some are specially charming, having spikes of highly-colored flowers, silvery foliage, and good habit, especially Nos. 3454 and its variety, 3463, 3472, 3479, and 3487, though all the perennials are fine in habit and color. They will flourish in any soil, but a rich loam will produce the finest plants and flowers. The dwarf species make the best bed- ding plants. The flowers are pea-shaped and the plants free flowering, merit- ing extensive cultivation.

4067	Portulaca splendens	2 3	tA	pur.	$\frac{1}{2}$	5	These cannot be rivalled for the brilliancy of their colors, and are one of the best Annuals for bedding. <i>Oculata</i> , with red stalks, is very fine. The last 8 are double flowers , and are especially beautiful, many of them resembling miniature roses, the seed of which always contains many single flowers, which flower earlier than the double ones, and may in this way all be pulled out before the double ones come into bloom. Bloom best in a rather sandy soil. The seed will not vegetate till hot weather sets in, and should therefore be sown late.

 All Strictly Our Own Selection. 

IMPROVED FRENCH AND GERMAN ASTERS.

In this latitude, Asters should be sown from the middle of March to the first part of May, on a spent hot-bed, or in pots or shallow boxes in a frame, or in the house, and when an inch high they should be transplanted into fine soil, which should be spread over a discarded hot-bed, from whence they can be bedded out when about three or four inches high. This should be done during or immediately after showery weather. *Asters do finely sown in the open ground in the middle of May. The only objection to this mode is their late and short duration of flowering.*

 In ordering these Collections, please give the numbers of the particular Assortments desired.

GERMAN TEN WEEKS ^{AND} OTHER STOCKS.

Sow at the same time, and treat in precisely the same manner as Asters, except that they may be transplanted several times with advantage in the earlier stages of growth, the shift tending to give them a more compact and dwarf habit.

 In ordering, please give the numbers of the particular Assortments desired.
